Hi, I'm trying to get my ST on the net using STIK and the SLIP.emulator SLIRP.

But I'm having problems. Stik doesn't get further than 'Resolving Hostname'.

I've got two DNS-addresses, so that's not the problem. Anyone got any ideas?

Maybe STIK and SLIRP just don't like each other.

Thanx, Casper.Post subject

1787. What C package?

I don't know for certain, if it is supported, by new releases. Current
[5.06.01] release in my possesion, is stable, works on anything from an St to Falcon, with all the
hooks to the falcon, and TT tos'es already. Complete with speedo/mTos/mint
stuff. Works with Multitos quite well, with geneva 'sort of'.

HISOFT at UK is probably the European distributor.

I have heard no rumors, about an english doc'ed Pure C. There is
an English online help package available for Pure C, from a third
party.

1788. HELP-Pure C programmer req'd

Source record: 10427

Hi, I am using the GFA Basic Mydial routines supplied with the Interface
resource editor. This consists of a a file called MYDIAL.OVL which has been
compiled with Pure C and a few GFA Basic procedures to call the C code.
I am trying to use the 3D dialog functions supported by Mydial, but the
switch passed when initialising Mydial has been left out of the C source used
to create MYDIAL.OVL.
I have worked out what needs changing, but I am not a C programmer and do
not have a C compilers. The docs for Interface ansd Mydial state that the
source provided is intended for Pure C and will also work with Turbo C.
Would sone kind soul be prepared to compile the source to produce the
MYDIAL.OVL file for me.
Many thanks in advance.

What version of STIK do you have? I had an earlyish version and there was
a bug in it which wouldn't connect past that point, try getting an update.

Also, you have to tell your server to make the PPP/Slip option Slip only
for your account, STIK doesn't like the PPP option.

You can used the newly proposed system-level SCSI driver interface - the
CBHD public domain driver uses this, and a detached SCSI driver is also
available. By doing so, your code will work on *any* SCSI interface where
a low-level driver is available.

If noone else does this, I will make this stuff available via FTP as soon
as it is complete.

> Hi guys,
>
> I am writing a program that also works as an accessory, and yet I am having
> problems.
> [...]
Under SingleTOS, calling Malloc may cause serious problems. The memory does
not belong to the accessory, but to the current application and will be
freed when this application exits. In an accessory, the only reliable _and_
clean way is to work with a fixed heap. This may either be a static area
stored in the BSS or memory allocated directly at the beginning of the
accessory initialisation (i.e. after the startup code). Calling Malloc
or other calls which may alloc memory (e.g. rsrc_load) at startup should
be protected with a wind_update(BEG_UPDATE/END_UPDATE)-pair to prevent the
autostart-application (if any) from being loaded too early.

Of course, if you make sure that you are in a multitasking environment
(check the global-array, I think global[1] > 1), you may call Malloc without
having to worry about the problem mentioned above. This is why your
accessory worked with MagiC, but not with SingleTOS.

Hope that helps...

Ciao

Thomas

Erm. Can you describe this a bit more? I'm using GFA, so I don't know if things like this are possible. This is under normal non-mtasking TOS, yes?

Cheers

> Erm. Can you describe this a bit more? I'm using GFA, so I don't know if things like this
> are possible. This is under normal non-mtasking TOS, yes?

:-)

There is a TOS system variable called the current process pointer (or something like that). Basically, under single-TOSes it contains the address of the current process' basepage. All you do (!) is save the old value, then copy in a pointer to your parent's basepage, call Malloc, then copy the old value back.

You can find a pointer to your parent's basepage in your basepage: I don't know if GFA gives you access to this :-(

This stuff DOES NOT WORK (nor is it needed) under multitasking TOSes.

Come to think of it, perhaps you find the current process' basepage using the ROM header. It is documented in things like the Compendium, anyway.

>this isn't an issue. If it's running a standard GEM program, the only
>register that the trap re-director will corrupt is a0, but I will fix
>that if it's problem.

I don't think that's a problem, but I still don't know how one can compile one's program and have control over what registers will be used. Or do all C compilers save all registers before calling another routine? I know that Pure C has a compiler option `no register optimisation' which, when turned on, will make sure the contents of all registers will be reloaded before any use. But this will definately make things slower...

About the stack vs. register passing of arguments in Pure C (as mentioned in Eric Smith's reply), I thought the FreeMiNT sourcecode has been made with ingenious IFDEFs and such, so that when Pure C is detected, all functions will have the `cdecl' switch.

Please, don't do that. This would be considered dirty programming because
you gotta write the current-process variable, which is documented
as read-only. On later TOS versions (certainly on mtask versions) the
program may very well crash.

> Oh, welks.
>
No, you misunderstood. It can be done by utilizing the AC_CLOSE message.
But there were rumors that occasionally this doesn't work properly.
However, it worked fine when i tried this.
After receiving the AC_CLOSE message by evnt_multi() you _must not_ call
any further AES function before you've freed _all_ memory that has been
allocated after bootup time. The reason that you must free that memory
I've explained earlier. You must do it _before_ the next AES call because any
AES call may do a taskswitch, completing the main application shutdown.
That shutdown would release all that memory, and from that point you may
neither access the memory (of course) nor free it ('cos it's already
freed and TOS is programmed badly enough that it cannot cope with free
memory chunks that are freed again).
The thing is dangerous anyway, 'cos you gotta expect bugs in single-TOS
everywhere (the rumors I mentioned above probably got to do with that).
So it's certainly safer to do without these things.

Cheers Peter

If so, can you let me know what files I need please, as it's beginning to really irritate me!!!

I've got as far as getting an object file, but it won't link, aaarrrgghhhh!!!

E-mail me on I.D.Cadman-CSSE94@cs.bham.ac.uk, if you're feeling in a helpful mood!

1803. BAD MOOD progress update

Newsgroup: comp.sys.atari.programmer
Date: 1995-11-29 00:00:00 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <49ilmp$fp4@nyheter.chalmers.se>
Source record: 10439

```
The BAD MOOD internet project to create a FreeWare Falcon030 DOOM(TM)
WAD compatible game has recently taken a huge leap forward.
This is mostly thanks to the work by Douglas Little (of APEX media).

Version 1.32alpha of BAD MOOD is now available via WWW/ftp (see .sig).

So what's new?

- No more C code!
The full '030 assembly code is included.
- Runs in Falcon true colour mode.
Both RGB and VGA are of course supported.
- More than two times speed increase.
In _many_ places it's _far_ more.
- The display can be resized.
At 160x100 the frame rate is usually _very_ nice.
- All display glitches have been removed.
- A 2D map can be overlaid.
- Mouse control added.
- Some lighting effects.

...and more.
There's also a first DSP aware executable in the distribution archive,
which if course improves the frame rate... ;-)

For those of you without Falcon's, the C version of DVIEW has also been
updated. Versions are available compiled for the old 68000 Atari's as
well as for '020+ machines. These versions run in 16 or 256 colour bit
plane modes. Full C sources are included.

By the way, it has been discovered that BAD MODD (and DVIEW) actually
loads DOOM 2 and Heretic WADs as well as the original DOOM ones.
A tip: third party WADs work fine and are usually a _lot_ smaller than
the commercial/ShareWare ones.

Not long ago I posted an article asking why my Falcon program could change resolution and back to normal ok without blowup, but the screen is messed up when you get back to the desktop with blowup turned on.

Aparently this was a bug with blowup and have since installed an upgrade which was supposed to fix this - but alas no.

I there anything you need to save apart from the modecode before chnging resolution ?

Would I be better off saving the size of the screen using Vgetsize()
and returning to normal memory using that ?

Thanks,
Phil.

>routine?

Most Atari C compilers preserve D2-D7/A2-A7 across function
calls; unfortunately, Pure C 1.0 uses D0-D2/A0-A1 for passing
parameters and thus *does not* save D2 - which may cause
problems if a program that *wasn't* compiled with Pure C 1.0
calls a function that *was*...

Examples of this: GEM AES (when it calls USERDEF functions) or
the Minix FS driver (when it calls MiNT kernel functions through
the kerinfo struct); the latter only is problematic if MiNT was
compiled using Pure C 1.0 and the FS driver wasn't...
(And you simply *can't* compile the current Minix FS driver with
Pure C since it uses some GNU C extensions.)

You might have noticed the Pure C version number: this problem
was sovled in Pure C 1.1 - functions using `cdecl' (stack)
parameter passing now save register D2, too!
(This is not documented (AFAIK), but verifyably true...)

Note that all this only applies to *direct* function calls -
calls using a TRAP interface don't have these problems, since
the upper level of the trap handler is always written in
assembler and does all the necessary register saving anyway!

> I know that Pure C has a compiler option `no register
>optimisation' which, when turned on, will make sure the contents of
>all registers will be reloaded before any use. But this will
>definately make things slower...

That won't change very much - the register variables (D3-D7/A2-A6) are automatically saved anyway; there are only two valid reasons for turning off register optimization: firstly, the Pure Debugger doesn't handle re-allocation of register variables too well, and second, the optimizer still has a small bug - sometimes (rarely) the register allocation scheme will go wrong in very complex expressions...

>About the stack vs. register passing of arguments in Pure C (as
>mentioned in Eric Smith's reply), I thought the FreeMiNT sourcecode
>has been made with ingenious IFDEFs and such, so that when Pure C is
>detected, all functions will have the `cdecl' switch.

They should, but I'm not sure how extensively this was verified and tested...
(BTW: you only need `cdecl' parameter passing for functions callable from the "outside" - purely internal functions can continue to use register parameter passing, possibly gaining some speed!)

Hm, wait a moment... I have a Falcon and Pure C. And a big problem: The editor is absolutely incredible slow when the code gets big (well, not real big, lets say bigger than 100 lines or so...:-( )
I don't know why, but I'm just looking for some other solutions. Maybe I could just use another editor with the compiler and linker of Pure C, but I have to try it i.e. to get a good, fast editor first.

I have an Atari Mega and for the last several years I've been writing a novel on Word Writer. Now I need to print out eight hundred pages on a Canon BJ200 bubble jet printer, and I can't get any compatible drivers. If I convert it all to ASCII, I'll loose all my formatting. Can someone please help me in obtaining something that will work? Or point me to a source? Canon doesn't want to help me. I'm desperate! Will someone help me out of this nightmare?

You have to generate a .sym file too. You have to use sym-linker for it.
You'd rather look to tex documentation of gcc and gdb...

1820. Screen size detection

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-02 00:00:00 UTC
From: jamesco@cogs.susx.ac.uk
Message-ID: <49p5lk$9pn@infa.central.susx.ac.uk>
Source record: 10309

I am in need of finding the screen dimensions, number of bitplanes etc for the screen, however, without using the VDI...

This question could probable be read: How does the VDI figure out the screen size/number of bitplanes etc.. given the fact that there are such things as 17" SVGA monitors, Screenblaster hardware, virtual screens, and reflex/supernova graphics card (etc, etc, etc..)

Cheers,

James Cox <jamesco@cogs.susx.ac.uk>

I must correct myself here - I just happened to notice the following
line in the MiNT documentation (Appendix E):

>(for example, Alcyon C preserves only registers d3-d7 and a3-a7)

Apparently Alcyon C saves even fewer registers than Pure C; since
Alcyon C was used to compile the GEM AES, USERDEFs compiled with
Pure C 1.0 shouldn't cause any problems...
(However, the MiNT/MinixFS problem is real!)

Martin

^^^^^^^^^^^^^

According to the Compendium :
global[1] is the maximum number of concurrent apps supported.

MonoTOS ("SingleTOS"? "UniTOS"?) returns 1 in this element of the array.

MultiTOS returns -1 (meaning "unlimited")

---- ----- ------
SHW_IMMED 0 PC-GEM 2.x
SHW_CHAIN 1 TOS
SHW_DOS 2 PC-GEM 2.x
SHW_PARALLEL 100 MagiC
SHW_SINGLE 101 MagiC

SHW_PARALLEL

Start new process in parallel. Returns application id of the new
propgram; when this terminates the "parent" receives the CH_EXIT
message. 'gem' non zero denotes a GEM application whereas zero denotes
a TOS application (which will get run in a window).

CH_EXIT

Sent to parent process when child (started via shel_write()) has
terminated. msg[3] contains the application id of the child, as
returned by the shel_write() which invoked the child, and msg[4] the
child process exit code.

Doesn't your canon do epson emulation? If it does, then assuming Word
Writer has an epson driver, you should be able to print your novel.

(This question is relevant to MagiC 3 as well as MagiCMac, I suspect).

I am having difficulty finding a Pexec mode supported by MagiCMac that
does what I want. Under MultiTOS, I would use Pexec(100, ...), but
this seems to be unsupported under MM :-(

All I want to do is start a TOS program from another, but without the
parent blocking until the child completes. Under MultiTOS, this should
be something like

```
Pexec(100,...);
do_something();
Pwait(); // Wait for child to exit
```

On the falcon, both serial ports are 8530 based. There are several manufacturers
of this chip, so obtaining a users manual shouldn't be a problem.

If you want to see example code, download sources for linux-68k. You can find
an SCC (8530) driver in drivers/char/atari_SCC.{c,h}.

By the way--I do not believe the Falcon has DMA for the SCC, thus achieving
a decent baud rate will be a problem :(.

>(It'd also be nice not to lose my Modem port in the process although rumor has

>specific specs would be fine.

I'm not sure which modem port you're refering to. I have a Falcon. If you're
talking about it's RS232 port--no problem. Both ports can be in use at the same
time.

AIUI, the Canons emulate Epson 850LQ or IBM Proprinter X(L)24E. There
really is no such thing as a "Canon
driver".

It's best to pick the Epson emulation as the drivers are more
common.

Rob,

r > My compiled program bombs (2) after my welcome alert. In a
r > crude attempt at trying to find which line of code was at
r > fault, I inserted lines like...
r >
r > PRINT "1"
r > PAUSE 50
r >
r > ...between the existing lines (the "1" is incremented each
r > time). This time the program ran fine!

Usually, when a program runs fine in the interpreter, but crashes when compiled, it is due to one of a number of memory handling problems.

First, you may be RESERVE'ing less memory than your program requires. In which case the program will crash when your program goes beyond its defined memory limits. Try increasing the amount of memory you RESERVE at the start of the program, and remember to RESERVE memory only ONCE at the start of the program, and then release it when you exit the program.

Second, you may need to force a garbage collection. Try replacing the PRINT "1"/PAUSE 50 lines with a ~FRE(0) and see if it solves your problem. GFA doesn't always clean up after itself very well, and you have to do it manually sometimes. I usually put the ~FRE(0) command in my programs event loops.

Third, you may be using up too much of the free memory, and not leaving enough for the OS.

```
r > max%=MALLOC(-1) ! find out how much free memory is available
r > IF max%>1000000
r > max%=1000000 ! to keep from claiming too much memory
r > ENDIF

r > s%=MALLOC(max%)
```

In the example you gave, there is no allowance made for the OS. If you have exactly 1000000 bytes free, you are using it all. Try allocating this way to save 64K for the OS to use:

```
max%=MALLOC(-1)-64536
.... Insert your error messages here ....
s%=MALLOC(max%)
```

Good luck!

There's no reason at all to do it yourself - you can always use the VDI
functions to determine screen size, colour depth, etc...

Why do you want to do it without the VDI? The only reason I could think
is that you want to do it from an Auto program, and that's not really a
reason at all (you just have to remember to open a physical workstation
to the screen, and close it again when you're through if you want to have
GEM start after your program exits).

>engine for yet another platform...

We asked id Software in our letter what they thought about the project,
but they've not replied. We'll try normal mail as well.
In the current state there is of course nothing id could complain about.
So far BAD MOOD is not much more than a glorified WAD viewer. Similar
FreeWare and ShareWare programs have long been available for the PC.

>if, however, its totally freeware, then you should be ok, but don't
>say I didn't warn you. =]

BAD MOOD is, and always will be, totally free.
We're well aware of the potential problems, though, which is why we've
tried to get some kind of official statement from id.

MagiC returns something like 10 or 16. The test for multitasking TOSes
should clearly be 'AESglobal[1] != 1'.

Source record: 10327
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

I have a program, compiled with gcc, that crashes after receiving SIGCHLD. I ran dbg on it and it clearly said: "Program stopped with signal 20 (Child Process Exited)". As far as I know, it isn't normal for a program to crash after receiving SIGCHLD, the default is: no action. The program crashes both under MiNT and under normal TOS.

It doesn't matter if I execute the child process with Pexec (mode 0) or the standard lib function system().

Any ideas what could cause this behaviour? And what can be done about it?

The same program compiled with PureC executes flawlessly.

1841. Problems compiling a GFA 3.5 program -- please help!

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-04 00:00:00 UTC
From: robaries@aol.com
Message-ID: <49u5an$8gl@newsbf02.news.aol.com>
Source record: 10330

I have a few questions regarding compiling GFA 3.5 programs. I'm having a problem and can't figure out why. My compiled program bombs (2) after my welcome alert. In a crude attempt at trying to find which line of code was at fault, I inserted lines like...

```
PRINT "1"
PAUSE 50
```

...between the existing lines (the "1" is incremented each time). This time the program ran fine! I then started commenting out these lines, one set at a time, and re-compiling. Sure enough the program bombed after all but the first set of these extra lines were commented out. I'm at a loss as to why the inclusion of these lines would make the difference between my program bombing or not. Here's some of the code:

```
[......]
max%=MALLOC(-1) ! find out how much free memory is available
IF max%>1000000
max%=1000000 ! to keep from claiming too much memory
ENDIF
ALERT 0, [etc... my welcome alert]
PRINT "1"
PAUSE 50
s%=MALLOC(max%)
PRINT "2"
PAUSE 50
IF s%=0
ALERT 1,"Couldn't allocate memory.",1," OK ",blah%
END
ENDIF
DEFFN done=(MOUSEK) OR (too.much!) OR (INP?(2))
PRINT "3"
PAUSE 50
DEFFN file.ok=filename$<>"" AND RIGHT$(filename$)<>"\"
PRINT "4"
PAUSE 50
[....]
```

As I said, the program seems to run fine with all these lines enabled. I start commenting out the PRINT...PAUSE lines, starting with the higher numbered ones and working back, and re-compiling each time. When I comment out all but the PRINT "1"...PAUSE 50 and PRINT "2"...PAUSE 50 pair, I'm back to bombsville (after I click on the "OK" button of my welcome alert, the numbers "1", then "2" appear on the screen, then I get two bombs and I'm back to the desktop).

A few things: I'm running TOS 2.06 on a 520st expanded to 2.5 megs. I'm using MENU.PRG (with its default settings) to compile with; the return codes from both the compiler & linker are 0 (good). I've tried booting the ST with no accs or auto progs (except ICDBOOT). Nothing has worked! Any help, or clues as to how to look for the cause of this, is appreciated! TIA,

Rob Aries

>
No way. VDI is told by the screen driver how large the screen is. You
seem to worry about functioning with foreign hardware, so you have to
solve the problem properly. There is only one single way and that goes
via VDI : Open a workstation and the screen resolution and number of
bitplanes etc. is written into the intout array. Then you can close it
again. But there is no proper way without VDI.

Cheers Peter

1844. New problem with Stik

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-05 00:00:00 UTC
From: markuss@sim.techem.ruhr-uni-bochum.de
Message-ID: <4a1cst$51c@sun168.rz.ruhr-uni-bochum.de>
Source record: 10333

Hello all !

As many people, I have some problems with Stik. But not the same like other
people here. The problem only occur, if I want to use CAB. IRC works fine.
I have checked the posting in the Usenet, but their problems (setting
of the Cache-directory, uncompressed SLIP) doesn't fit here.
First I describe the problem that occurs:
If I try to load some pages, CAB stops reading the data of the page or an
inline-graphic after around 1600-1700 bytes. Then after a while CAB continues
to load the next document (seems to be a time-out). The error occurs always
with the same document or graphic. So a document does always work or doesn't
work always. IRC works fine.
Second I describe my system:
I have a 520STM, 2,5 MB, HD, 38400 Baud. Software is Overscan, NVDI3, and
HSMODEM6. But the error is the same even with only Stik and HSMODEM. I'm using
the www08.zip archive. The next is a part from my default.cfg:

```
TTL = 64
PING_TTL = 255
MTU = 576
MSS = 536
PKT_SIZE = 2048
DFB_SIZE = 2048
RCV_WND = 2048
```

My Atari is directly connected to our server, a 486DX100 with Linux, over a
uncompressed SLIP-connection. Connection over a terminal works fine.
Third I describe our trys to resolve the problem.
I have talked with our system-administrator about this problem and we have
checked the packages, which are sent between the computers, and tried
different settings of the default.cfg. We have found the following:
The server sends packages with the size of 536 and the atari sends packages,
that he have get them. The window-size decreases every time. After around
1600-1700 bytes, there is only a small window-size left (e.g. 191 bytes).
The server then sends a package with this smaller value, but the Atari
doesn't respond to this. Then the server sends this package every few seconds
again, but the Atari never sends a message, that he have get them.
We have tried other values of MTU, but no changes.
We have tried other values for RCV_WND, but the window-size the Atari sends
to the server is always 2000 !
Our Administrator told me, that there have been the same error in the first
Linux-versions and he have corrected this (he is one of the developers for
Linux).
Does other people have seen this error, too ? Or does somebody knows, what
to do ?

Bye, MarkusS.

Recently, I was playing around with the desktop.inf file, seeing what all the stuff does, and Something Is Not Right now. What happens is when I come out of a program, or even from the text viewer, an extra window appears on the desktop! It's a normal window, but the window that was previously open shrinks to the smallest it can get! Another thing about it is, that when this window appears, I not sure how to describe this, but there's a flash of color diagonally down from the corners of the window, almost like there was a window closing just before I come out of whatever I was in- get it? Clear as mud, no doubt.

Anybody have any ideas on how to fix this? I'm not sure how this happened, because I made sure the file was back the way it originally was, but it's still Messed Up. Perhaps someone could send me their desktop.inf file so's I could see if I maybe didn't get it back quite right or something? Any help would be greatly appreciated.

Cheers- Peter Keller

Are we just talking Falcon here, or does it have to be ST compatible (for Novas
etc)?

If its just Falcon, then I can help a bit... Take a look at the hardware register
listing - contained there is a lot of stuff about the horizontal / vertical
border / screen size.

To calculate the height, its (vertical_screen_end - vertical_screen_begin)/2
(its measured in half lines), *2 if Interlace is set, /2 if double line is set.

Width, I cannot remember off the top of my head, but its all there...

Bitplanes: This is the tricky one - The hardware register listing gives an address
which has 2/256/65536 colour mode flags, but not 4/16. I have been told by a
number of people that this can be found by examining the ST Shifter address...
I still haven't yet got around to sticking this code in, so I dont know this
for certain...

Hope this helps... mail if you need more specific info...

Anthony

1849. Linux for Atari/HD partitioning

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-05 00:00:00 UTC
From: nhughes@cln.etc.bc.ca
Message-ID: <1995Dec5.112316.16511@news.etc.bc.ca>
Source record: 10338
Cross-posted to: comp.os.linux.help,comp.sys.atari.programmer

I own an Atari Falcon 030 which I use as a hard disk recorder (with Cubase Audio), as part of a multimedia studio. Recently I have been given access to a pair of Seagate Barracuda 2.5 gig HDs. They are beautiful drives but the obsolete Atari "TOS" OS insists on limiting partition size to 256 megs and refuses to accept more than a gig per SCSI id number. These are ridiculous limitations on an otherwise fantastic system; it would be great if my computer also had full access to these drives!

I have heard that Linux has been ported to Atari. Can anyone explain what the implications are for a Falcon platform? Essentially, I am looking for the ability to create large (multi-gig) partitions; my system must function with 16 megs of RAM, so turning the Falcon into a Mac would probably be out of the question ;)

If anyone could help get me out of the Stone Age, I would really appreciate it! If you prefer to reply via E-mail, you can reach me at agreenwe@castle.uvic.ca

Thanks, Anand

I think they are on the Line-A _variables_ (it's functions that aren't
supported by new OSs). I'm not sure about how to access them (SozobonX
C doesn't support it, but GCC has at least a linea.h header file...).

Just install a better hard disk driver. HD Driver (a commercial product)
allows much bigger partitions, and works faster as well.

> I have heard that Linux has been ported to Atari. Can anyone explain what
> the implications are for a Falcon platform? Essentially, I am looking for

Yes you can have big partitions under Linux as well. I have a Conner disk
without several large partitions and one gigabyte or so partition. No problem.

Source record: 10343
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

i tried to install gnu c++ (version 2.5.8) on my standard falcon (4MB ram)
and have some problems.

1. i use towsin14(?), tcsh (from tcsh.zoo) and vi (elvis17.zoo)
when i start vi in the tcsh then i cannot move the cursor with the
cursorkeys. Does anybody know why this doesn't work?

2. after the installation of gnu c++ i wrote a test programm hello.cc with
one includefile and one output line. when i try to compile this i will
get a message similar to this: "virtual memory exhausted".
after starting MiNT, TOSWIN and tcsh i have around 2MB of ram left. Is
that not enough or is there an error in my installation?

if it's not possible to use gnu c++, is there another c++ available for
the falcon?

please answer also with email, because i cannot always get this newsgroup.

thanks in advance

Patrick

If you want to be compatible, the best way to go is to use VDI... However, you could write a routine for ST, one for Falcon, one for TT etc. and then stick a little machine detector code at the beginning, which selects the correct one...

> Anthony> You detailed how to get screen width from the Falcon's hardware
> registers - will that work even with hardware Screenblaster's? (I assume it
> does, but I know very little about how things work at the hardware level)...

To be honest, I dont know, as I dont have Screenblaster, or any other hardware video-upgrades. It does work with FalconScreen, the software enhancer, and probably with all other software ones, but I dont know whether it works with hardware... Anyone?

(James: do you have screen-blaster? If so, then I could send you my code, and find out...)

Anthony

1857. Extra MegaSTE Ports

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-06 00:00:00 UTC
From: awatson@pacifier.com
Message-ID: <4a4rf1$ga0@news.pacifier.com>
Source record: 10346

Hello,

I am looking for info on programming the Modem 2 and Serial2 ports on the MegaSTE. I already have the Atari Compendium, as well as the Atari Developer docs, but neither of these explains "HOW" to program these ports.

Specifically, I need to know how to set the Baud Rate (i.e. 57600 or 115200 baud), how to select which port I want (Modem, Modem 2, Serial 2), and how to send and receive data from those ports.

An example in BASIC or Assembly would be appreciated, though it doesn't need to be very extensive. Just a simple sample showing how to select the port, set the baud rate, and send/receive a byte to/from the port.

If you can help, Thanks!

I have a TT with 4 meg of memory, a 19 inch monitor that I would love to sell before christmas. It has been sitting lonely for the last
several months waiting for someone to use it. No one does. This system is going cheap. If you are interested, leave e-mail to
tthompso@pcshs.com.

I have alot of software to send if you are willing to pay the freight. (ie. Pure C. many terminal programs and a list will be made for the
buyer of the system.)

I also have an old ST 520 1meg machine, with mono monitor.

leave e-mail to

Can anyone recomend a good C++ compiler for the STE. I need one tonight because a my programming project needs a lot of final work, and its due in tomorrow (Friday)! I will need an ftp site where to get it, if known.

I've tried GNU g++, but it only works on systems with hard drives.

Sorry about cross posting but this is urgent!! :-(

Cheers,

Fraser

You still lose, as you don't cater for any graphics cards.

.....
> does, but I know very little about how things work at the hardware level)...
>
I was afraid of this ;-) Lets take my maschine for an example. Currently
I use a screen resolution of 960 x 544 with original on-board hardware of
an old 520 ST+. This is possible by uprating the board clock to 12 MHz
and giving to the ST video hardware new Vsync and Hsync signals. I can
even use my old SM 124 for this resolution (indeed, it does it !). This is
very cheap (cost me less than 30 bucks) for considerably increased screen
resolution, therefore I think that quite a few STs have been upgraded
this way. For any software looking to the hardware register this computer
looks precisely the same as with the original 640 x 400 resolution. You'd
have to do careful timing measurements to see the difference. I only need
a tiny driver that allocates screen memory, sets the video base adress,
and writes according numbers to the LINEA Variables when AES calls the
open_workstation VDI function. Thats all, no resident driver code.

I'm absolutely sure that any software that doesn't use VDI and tries to
figure out the screen resolution on my maschine will fail, unless it is
carefully trimmed to my kind of hardware (which would require quite some
afford).

I'll will go even further soon. I got some 19 inch computer monitors and
I'm about to build a graphics card for them (1024 x 864) that will need
even less software aid, and will still look like original 640 x 400 when
looked at the hardware registers.

So there is no way to fulfil your promise :
> I am really after making a general purpose system that would work with
> all Atari's, ...
unless you use VDI !

Hope that clarified things Peter

AFAIK, g++ is the only C++ compiler ever ported to the ST.

I have a Canon BJ200 as well, and I've made some changes with the dip
switses, so I can (and does) use a printer driver called EPSON 850..
Check your manual for a complete list of compatiable epson printer drivers..

Hope this helps..

Greets Jakob :)

what?

AFAIK the blitter in the Falcon cannot be turned off, BUT NVDI has a switch
(set in the CPX) that allows it to avoid using the blitter for any routine
it supplies that would use it. However, it cannot prevent other programs
from using the blitter it they bypass NVDI by using the blitter
directly.

They're simply too big.

Last week I tried to reduce the entropy in my room by rearranging some old magazines
that were lying around on the floor. I had a quick look into some of them and there
was an interesting article from 1991 about Objective-C for the Atari. It wasn't a
stand alone compiler but more kind of a preprocessor which translates Objective-C
into 'normal' C to be compiled using a C compiler. I haven't heard of this anymore
so I believe it's not available either ...

I would have thought that it would work, as it is quite easy to test the
line_a variables. As its not a Falcon, checking the video register is
not much use for screen-size detection if you want it to work with enhanced
modes...

> So there is no way to fulfil your promise :
> > I am really after making a general purpose system that would work with
> > all Atari's, ...
> unless you use VDI !

True - If you want to be 100% compatible with all the possible different
modes you should go with the VDI...

I dont know if they do, but shouldn't graphics cards put a cookie in the
jar to make it easy to detect what resolution it is???

Source record: 10367

hi there,
my name is elad, and i know nothing about Atari (except the TV-game...).

I have a musician friend who works with ATARI 1024, and uses a
proffessional MIDI application (called CILAB).

I own a pc computer, and want to transfer midi files from my friend, but
my drive won't accept an Atari formatted disk (3.5").

Is there a way to transfer the disk to DOS ??
Can my friend save his files on the ATARI at a format that will be
acceptable by my pc ??

your answer would be most apperciated, especially if you send it directly
to e-mail: elod@math.tau.ac.il.
Thanks !!!

If I remember correctly, its a file missing, such as rsc or inf, or it
is also caused if the actual program you are running is incomplete,
Lets say you unzip a prg, you run that prg, if it was incomplete then
you would get error 35,

I would say you have something missing,

Cheers..............!ynoT

I have a system that I would like to sell, preferably as a whole, but I
will break it up if necessary. I have:

Atari 1040ST, 1 meg, mouse
Atari SC1224 color monitor with stand
Atari SX212 1200bps modem (blazing speed, eh?)
Atari SF354 single-sided external floppy drive
Gemini 8-pin dot matrix printer
All necessary cables and adapters

Everything is working 100% and in the original boxes. Make me an offer:
this thing is gathering dust in my closet, and I want to get rid of it.
Payment and shipping arrangements will be made when we make a deal.

If you reply to chris@flowerslabs.com, you'll get a slightly faster
response than from cjg48647@pegasus.cc.ucf.edu.

>Speedo ?

Traversing a simple linked list would get too slow. Also you need to store information for characters, not words. Many word processors embed this information in with the text and remember the current attributes and select them as "the internal cursor" comes across them. This is just one approach out of many.

For output, you want to be looking at ways that can output strings. Building a string output routine from a lower level character output routine will be too slow. If the mouse is involved it will also have to be turned off and on for each character which is bad news.

You want some method where you can look through the text to be output and build strings posessing the same attributes.

Using uppercase to represent bold ...

hello World.

You output "hello " as one string, change attributes to bold, output "W" as the second, change back to normal then output "orld." The same holds true for font changes.

I suggest you play with v_gtext() and its relations to get the feel of it.

As standard there are 3 targets for GNU C, gcc itself, g++ (the C++
compiler) and objective-C. Making them all is the default action for
the makefile that comes with GNU C.

I'm not sure if the a.a.u.e version of GCC makes in the same way (from
source), but if I remmeber correctly, if you're using MiNT/Linux the
standard C source compiles without too many problems.

ATB,
Simon.

Do you perhaps mean -35? The latter raises signal ENHNDL (Handle pool
exhausted), which means there are too many open files.

There is a GEM shell for GNU C (available on a.a.u.u or ftp.cnam.fr) and
then you're able to run any of your favourite GEM text editors.

> 2. after the installation of gnu c++ i wrote a test programm hello.cc with

For GNU C I always use virtual RAM (eg. V-RAM - shareware or Outside -
commercial) on my 4Meg falcon.

But I still belive that it's possible to run pure GEM without BLiTTER,
look - eg. it's possible with the Outside virtual memory because it
doesn't use BLiTTER at all. Do you think the Outside has it's own
blitting routines?

> P.S. Do you have any information regarding the accelerator made in Poland? I
> saw some of your postings to the linux-m68k mailing list regarding it...

So that's why I want to keep BLiTTER off. I'm writing the software for
the SpeedUp accelerator and there is a problem with BLiTTER at 50MHz
mode. On most of falcons is enough to put BLiTTER to half speed, but
there are some which didn't like to go at 25MHz (BUS speed) at all (even at
12.5MHz). And I guess I haven't to write my own blitting routines :(

However the SpeedUp will be officialy available on February '96. I have
one in my falconfor two months an it works very good (especially at 50MHz
with your old internal CPU you have over 200% of pure falcon and over
130% of TT with TT-RAM!)

best regards,

Simon.

Well, the suggestion to do these things came from a german magazine; the
details, however were for the 1040 STF(M). For other systems (like my 520
ST+) you'd need circuit diagrams in order to find the places of several
components and soldering joints.
Since it was published in german I think few people outside Germany have
build this. You'd have heard of it in the german Maus Net.

Sorry, little mistake of mine, some VDI ESCape variables are changed.
They don't exist on maschines like the TT, Falcon, Medusa, Eagle ...

You're right, it would be possible to read the variables. My point was
that it's impossible to take all hardware configurations into account.
And a hardware hack like this one on a Medusa (dunno if that makes any
sense) for instance would be quite tricky to detect without VDI.

> I dont know if they do, but shouldn't graphics cards put a cookie in the
> jar to make it easy to detect what resolution it is???
>

Would have been good, it Atari had initiated this; but because they did not, there is no standard for it, and every graphics card driver has it's own cookie name, so you gotta know all of them in order to get things to work on all maschines.

Cheers Peter

>quick algorithm for formatting with Speedo ?

I don't think a linked list for words would be smart, for two reasons:
First, you'd have quite a memory overhead, and second you won't be
able to change fonts _inside_ a word, which is not al that esoteric,
e.g. when using super- or subscripts.

I'm currently writing a Speedo wordprocessor; I haven't implemented
font and style changes yet, but intend to use a code at the place of
change. To speed things up, I have a special code to signal text
lines with no font stuff in them (after all, probably the majority of
the text) which thus do not have to be parsed and can be fed to f_gtext()
directly. But as you see, the hard work remains to be done yet.

To keep memory usage as tight as possible, I allocate textblocks when
needed (currently every paragraph occupies such a block), but I
already foresee trouble importing a large, `paragraphless' ASCII text.

The textblocks form a linked list, however.

But this stuff is giving me headaches anyway... :-) A wordprocessor
dealing with proportional fonts is about an order of magnitude more
difficult to whip up than a simple fixed-width one. (Just the cursor
positioning took me hours and hours...)

Good luck! (And expect to see my WP somewhere in 2010...)

I'll try to dig them out. I did these things about three years ago.
Meanwhile I noticed that not all SM124 can cope with a 48 MHz pixel rate.
But a rule of thumb is : The older the better. So if you have a really
old SM124 you might be lucky. Modern multiscan screens should do it
anyway.
I remember me buying a new CPU (a 16 MHz version of MC 68000), four
74ALSsomething to speed up the CPU bus drivers, a couple of resistor
arrays for proper bus termination. These things didn't speed up the
system, but made the board cope with 12 MHz. The system clock is derived
from the video clock (32 MHz originally), so it had to be replaced by an
48 MHz oscillator. There are two things that complicated all a bit :
The floppy disk controller still needs 8 MHz, unless one wants to create
his very personal disk format not readable on any other computer; and new
video syncs are required because originally they are not derived from the
video clock, I think.
The latter problem is solved by a little EPROM sequencer (about 2x2 inch)
that produces Vsync, Hsync, and DE (display enable) for two different
screen resolutions : 640x400 during AUTO folder execution, then switched
to 960x544 after bootup. This sequencer also incorporates the new board
clock oscillator (48 MHz).
The floppy problem is solved by another little daughter board (1.5x4 inch)
that features another oscillator and a new floppy chip. I used a new
controller because this way I could introduce HD technology (1.44 MB
floppies) into my system. The oscillator produces 16 MHz. This goes
directly to the FD controller for HD operation, it is divided to 8 MHz
for DD operation, to 2 MHz (for the sound chip, to correct for the pitch of
the sound system) and to 500 Hz for the ACIAs (needed for proper baud
rate for keyboard communications).
After all this is done the last thing to do is to adjust some pots inside

the SM124, to make the picture fit onto the SM124 screen.

Now the whole computer is faster by a factor of 1.5. It starts with a small picture (640x400), then AUTO folder programs are executed (the screen driver is one of those), then the picture will blow up to 960x544 and the desktop appears.

This system is most compatible (any program that runs with any external graphics card would run on this maschine; I tried MiNT with X-Window as a really hard compatibility test - it works !!!) and reliable (well, I had to replace the video chip about two years ago, but I do not think that was connected to this speedup.

The idea was from a german magazine, I'll look for that article. If you're really interested, get a german dictionary ;-) and give me a fax number.

Cheers Peter

1899. Can't delete folders on Minix partition

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-14 00:00:00 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-1412950845040001@47.85.0.99>
Source record: 10387
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

I have several folders on a 120 Mbyte minix partition that I cannot delete.
I have tried both the desktop delete & RMDIR (from a shell) with no change.

The error message I get is 'access denied' (-36).

These folders are not corrupt, as I can copy in & out files.

I remember the thread about undeletable files a few weeks ago & some of
the solutions involved editing disk sectors.

I cannot edit the hard disk, as I do not know enough about the Minix
format & besides I don't think any of my disk tools can handle it.

Am I missing something really obvious here, like permissions or user privileges?

Hmmm. I was under the impression that the Falcon TOS no longer has
VDI code that works without a blitter. That's why you have to have
NVDI to switch it off. (And it becomes faster, too... I don't really
like that. Try explaining that to your PC friends...: `But my Falcon
has an internal BLiTTER chip that speeds up the graphics - if you turn
it off.')

It could be that you don't have write permission for that directory
(permision to write = permission to delete).

Try `chmod 777 dirname', which sets all permissions on; you might also
have to do this to the directory which _contains_ the directories you
want to delete.

Hello,

I have had some problems with deleting files and folders on big machines (convex, hp, and co...) a few years ago. The solution i found is the following:

- go to the level where your folders are (supposing they are on the same level; if not, repeat the solution)

- create a folder on the level above:
mkdir ../toto (for example)
- move all folders (those you want to delete, and the others) and files of the same level in this folder:
move * ../toto
- go to toto:
cd ../toto
- move files and folders you want to keep in a safe place
- delete the folder toto:
rm -fri toto

With this solution, you can delete files and folders create in bad ways or with bad name and so on.If you can't move your folders, it's another problem such as protection, permission of writing, ...

Regards

>about upgrading.

From what I understand, they are the same, except that 2.06 is downward compatible with older Ataris (this is from the documentation with my TEC card). Such things as being able to turn the blitter on and off, and being able to switch from 8 to 16Mhz, are disabled in 2.06 when it sees that it's running on an older machine.

If necessary, you can invalidate the i-nodes and than run fsck, this
is normally the way fsdb(8) works, but it doesn't exist for minix.xfs
under MiNT.

> Am I missing something really obvious here, like permissions or user privileges?

Maybe, try `chmod -R o+w .' .

But what about when you've got a full-justified block, and you need to position
the cursor ? How on earth do you find the character it's on if you`re
justifying
using the VDI text functions ?

P.S. If you reply to this post, please mail me personally as well
<levon@cs.man.ac.uk> as I am going home for Christmas and my news only lasts a
couple of days. Thanks :)

Maybe the directory attributes don't include 'w'-flag (r-xr-xr-x). Try
'chmod' to change these flags to 'rwxrwxrwx'.

There is NO disk-editor etc. to change the 'low-level'-data of
MinixFS-partitions! This is only possible for plain TOS-partitions!

Maybe you should use 'fsck' to check the integrity of the Minix-Parition
too.

Ciao... Arno

: TOSWIN or even use a smaller shell (tcsh is rather larger).

2MB is tight for GNUC. THREE_POINT_FIVE (3.5) MB is tight for GNU C++. If you
really want to compile C++ code in 4 MB, use the smallest, nastiest shell you
find, and do not load TOSWIN or GEM.

: > if it's not possible to use gnu c++, is there another c++ available for

: AFAIK there is no other C++ running on Ataris.

Correct. G++ is the only one.

35 is a bad executable format. The OS has looked at the file and has no
idea what to do with it. The extension says it's executable, but the header
bytes in the file say it isn't.

1914. Basic 2 problem

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-16 00:00:00 UTC
From: m9174@abc.se
Message-ID: <4aumkj$lk6@tor.abc.se>
Source record: 10253

Hi,

I have a small problem regarding _reading_ and _writing_ files using HiSoft Basic 2. I believe the problem occurs with other Basic's as well (and perhaps other languages).

Just to get familiar with HiSoft BASIC 2, I wrote the following code:

```
data$=""
OPEN "analogue.sys" FOR INPUT AS #1
INPUT #1;data$
CLOSE #1

OPEN "test.sys" FOR OUTPUT AS #1
PRINT #1;data$
CLOSE #1
```

In my opinion 'test.sys' would have been an exact duplicate of 'analogue.sys' but it isn't. In fact 'analogue.sys' is 8393 bytes long, and 'test.sys' is 76 bytes long.

Just some details about the files. 'analogue.sys' is a synthesizer patch dump (also known as System Exclusive), and it contains ASCII codes from 0-255.

I assume my program runs into a 'end of file' code. But how do I write my code to read the complete 'analogue.sys'?

I'd be most grateful if antyone could help me with this one.

Install the HSMODA package and use Fcntl(2). The desription of the Fcntl
opcodes supported by HSMODA can be found in sersoft.txt (german and
english).

I can shed light on this one - the TERMCAP variable that TOSWIN sets
does not have all the entries - I have this fixed at home (which is
3000 Km away right now). I will be back on Jan 10 and I can post the
fix then - it simply means setting TERMCAP yourself in your
tcshrc.csh (or whatever your version of tcsh uses). You need four
additional entries for up, down, left, and right. I figured
it out by just looking at other termcap entries so you may be able
to do the same. I was going to try an update TOSWIN for AES > 4
features and fix small things like the termcap entry.

Good Luck,
Sam

Hi Carl,

Though this has nothing to do with Basic :-)

Have you made your Rev.D/C Falcon run at 36 Mhz now ??

Mine is running both 36 and 40 Mhz, much more stable than before. 36 Mhz is 100% stable!!

Keep Cool and Flying...

ChainXOR...

-- end quote
The language is Hisoft Basic 2 and there is no 64K limit on string length.
There is a limit,(2^31-1) or (2^32-1), I forget which but you need at least
2Gigs of ram to reach it. :) You are correct, It is inputing into a string.
This is a very efficient way to read large chunks of binary data.

>These folders are not corrupt, as I can copy in & out files.

I've come across one obscure situation where this can occur, which no-one
else seems to have mentioned yet. (I'm assuming you've using MiNT and
MinixFS to access your Minix partition.)

MiNT protects against any directory being removed if that directory is
the currect directory of any process currently in the system. Check that
you haven't got any stopped jobs whose current dir. is the one you're
trying to delete.

This can happen if, for example, I go into directory foo, 'less *' to
examine the files, Ctrl-Z to stop less, then I forget about the less, and
eventually decide I want to remove the directory and all its contents.
I then get 'access denied' messages when I 'rm -rf foo', reminding me to
check for stopped jobs. As soon as I kill off the 'less', I can remove
the directory.

Hope this helps...

Aaah! There you've put your finger on the sore spot. To tell you the
truth, I don't know. I think the only way is to do my own
justification and keep track of the offsets. Which is really a shame,
as it will probably slow down my output routines too.

Or - something I just thought of - if I set the justification routines
to `stretch spaces only', and devide the difference between the full
width and the unjistified line width by the number of spaces in the
line, I know by how much each space is stretched. I'll have to do
some experimenting to see if one-off cursor positioning (which will
probably happen in that case) is something that can be lived with.

Hmmm.

Do it right - use the

BLOAD filename$,address

command. This is a shit load faster than using input.
use VARPTR to get the address of a buffer to load into.

Or, if you want to load in segments, use the LIBRARY"GEMDOS" functions for doing
file i/o.

A big difference. Apart from stacks of other things (128,000 words, 340
pages, 101 tables etc) The Atari A to Z has full details on all the machines
and TOSes.
Only available from me and cheap!
Email me for further details.

I don't think you'll have any luck. On AIX, the -f option means the
command won't prompt for removing write-protected files, but it does not
affect the ability to do so. You see those option mean slightly different
things from Unix to Unix. Its better to get the proper man pages for your
specific implementation. My suggestion is to aquire the "manual" section
of KGMD, which AFAIK features a rather complete set of man pages.

Cheers Peter

Hello, people!
I have beren struggling for a while to set up
Gnu c++ on my falcon (MultiTOS, Outside and hard disk).
Is there a fools guide to setting up Gnu C on a TOS partition,
including a list of libraries and instructions on make files?
I would like to start C++ development on my machine ... I'm fed
up of programming for windoze at work! If there isn't any such
instructions file to make life a little easier, maybe someone
ought to consider putting their experience to some good use.
Also, does gnu c support some of the more recent C++
additions such as templates?

What about a AfterBurner040, it's suppose to make the 486DX2 look like a old ZX81 :-)
It performs a mere 1000 % in RAM-access (!!!!!) when running a program in FastRAM (GemBench results.) compared to a 16 Mhz 68030 Falcon!

> c> Mine is running both 36 and 40 Mhz, much more stable than before. 36 Mhz is
> c> 100% stable!!
>
> How much faster does your Falcon _feels_?

It feels quite snappy now, especially when running MagiC 4.

But old MultiTOS also runs quite acceptable now, compared to the crawling speed before I got the FastRAM.

There is a BIIIIIG difference in performance, when running in 36 Mhz with FastRAM in 256 colors on the desktop. I'm always running in 800x600 in 256 colors now.

MPEG-players are running much faster when running at 36 Mhz (of course the 50 Mhz DSP does something too).

Keep Cool and Flying...

1945. ICONIFY

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-21 00:00:00 UTC
From: Peter Rottengatter <perot@pallas.amp.uni-hannover.de>
Message-ID: <Pine.A32.3.91.951221160113.8837B-100000@iris.amp.uni-hannover.de>
Source record: 10284

Hi

I thought about introducing ICONIFY into some of my programs.
Unfortunately I have very little documentation on the topic. A few
questions :
The iconified window shows a little icon. Is it the AESs task to care for
this icon, or must the program handle the redraws etc. for the small
window with the icon ? If the AES cares for it : How do I tell the AES
the actual ICON to use ?
To uniconify I use the wind_set (... WF_UNICONIY ...) call. Do I have to
supply the size values that came with the WM_UNICONIFY message ? Or is it
automatically restored to the original size and position ?
How does ALLICONIFY work ?

Thanks for any info, as I don't own the MTOS programming docs.

Cheers Peter

A new version of EXTRA is well on its way. There will be several new commands and of course the usual improvements. The fee is yet to be decided. If you can't wait then write to Top Byte (address in most Atari ST publications) and demand it gets sorted out NOW!

Owners of the existing EXTRA 3.00 will be given the option to upgrade to version 3.10 when it is released. Again, the fee has not yet been decided.

One of the commands to go is lextra. I am sorry because I am sure so many of you used it to its capacity but it had to go to make way for other commands ;)

Thanks you to all those registered users who completed the questionnaire. The feedback has been taken on board and is appreciated.

Martin Cubitt, author EXTRA extension.

1948. Data compression routines WANTED (Atari ST Devpac 3)

You are responsible for drawing the contents of an iconified window. You just get WM_REDRAW messages...

> To uniconify I use the wind_set (... WF_UNICONIY ...) call. Do I have to
> supply the size values that came with the WM_UNICONIFY message ? Or is it
> automatically restored to the original size and position ?

I think you have to pass the values you get from the WM_UNICONIFY message into the WF_UNICONIFY command. The AES remembers the uniconified size & position of the window for you at any rate.

ALL_ICONIFY is a pig because you are responsible for remembering all your window positions before you close them.

This is sort of explained in the Compendium, although not very well.

Hi

Any STOS programmer here?, well there must be, it seems STOS was voted
best programming launguage in the Annual ST Format awards,

Well now we have our own page, for the latest STOS.FAQ the most
extensive S.EXTension list (that includes downloading and reading doc
files or mailing the authors), all the information about what articles
have appeared in 25 issues of STOSSER Diskzine, a list of all the files
given away in that diskzine, Download STOSSER,
Articles and info abound, aprox half a meg of text for you to read,
major update in January with a couple of hundred thousand more bytes of
STOS text for you, check it out NOW!

Works with CAB in low or Medium rez, best in med!

Tony Greenwood here, answering Tony Greenwoods quite reasonable
questions :)

I started TIMESLIPS nearly a year ago but the artist dropped out
(its a game, hopefully to surpass my last release H.E.R.O.) its
totally different, its BIG and has lots of new things, anyway no
artist, now I have finally got an artist interested in the
project and all the stored ideas are now being implimented, eerm
trying :)
Ready!, dunno, before summer hopefully,

1 Meg Atari fm or STe, I dont see why I should make ste specific
games or any other ste specific software just because I own one,
why would I want to ostracise < hmm is that spelt right? > half
the atari owning public?

It will be released as Public Domain as far as I am aware, I was
robbed with my first attempt at making money out of my programming
and you know what they say about "once bitten etc", it hasent put
me off :)

BTW I ahve just (tonight) finished the latest shell for WARP
Diskzine issue 4, so AFAIK it should be out this week, I have sent
it to the producer of the mag, hmmm maybe later as it is crimbo?

Cheers........!ynoT http://www.airtime.co.uk/users/stosser/

Ummh, what relationship is there supposed to exist between the subject
you choose and above question?

You find me thoroughly surprised at hearing there _are_ assemblers which
have a source line limit. All 680x0 assemblers I ever used and still use
have no such IMO ridiculous restrictions (Alcyon, Quelo, MAS, gas).

I once, probably in a transient (I hope!) state of mental derangement,
bought a C compiler package, where the assembler didn't know about forward
references (Pure C). Never before did I trash a software that fast...

: >Is there really much of a difference between 2.05 and 2.06? I am thinking
: >about upgrading.

I upgraded my machine some years ago with TOS 2.06 from TOS 2.05;
On the feature side, TOS 2.06 has an inbuilt memory test, the Atari logo
appearing on bootup; mybe some bug fixes I do not remember (the serial
port drivers?)
But most importantly it is the first Atari TOS version to support 1.44
Mb disk drives correctly, which TOS 2.05 doesn't. So, if you want to
install a HD drive or use one, TOS 2.06 is the choice. And - it runs on
all 68000 Atari machines, detecting the type of machine itsself.
However, I hardly remeber all details, as I haven't seen TOS 2.06 for a
long time. I am using Magic4 right now and recommend
upgrading to this TOS version instead of TOS 2.06.

> QQQQQ Where are all the programmers,?

We're all working hard... :)

> Q Q Is there anyone out there programming,?

Well I am.

>Q Q What are you programming,?

The definitive Atari Sysex software.

>Q Q When will it be ready?

Ooh, software release dates and all that...
I dunno. Weeks, months... as soon as it's decent enough
for release, really.

>Q Q Q What machines is it aimed at?

All Ataris with Midi ports.

> Q Q What type of release? ie pd etc

My first shareware proggie - but cheap, for what it does.

> Please reply in here rather than email, lets all talk !

I think programmers are notorious for not giving away too many secrets in
case someone else steals their thunder (and ideas :)

Anyway, I think there's plenty of mileage in rewriting old and useful
utilities to modern standards (multitasking OS, flydials etc etc)

rec.games.programmer or comp.os.msdos.djgpp :-)

> Q Q Is there anyone out there programming,?
Probably.

>Q Q What are you programming,?
Version 2 of an RPG Construction Kit called Hexaid.

>Q Q When will it be ready?
Never. When I get enough bright(?) ideas I'll start Version 3.

>Q Q Q What machines is it aimed at?
ST/STe. I don't have a Falcon or a Mega, so I don't know.

> Q Q What type of release? ie pd etc
I'll figure out the easiest way for the person who tried version 1 to
get a copy later.

Devpac from HiSoft I guess. I have it myself, and I can't remember any
troubles with huge sourcecodes. Devpac v3.1 is the best assembler
package available for the Atari (at least in my opinion). HiSoft is also
selling a Falcon030 enhanced version of it.

1961. Message #1024

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-24 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4bje2e$g0r@inca01.inca.co.nz>
Source record: 10200

I have recently rewritten my GEM apps, and as part of that, they now report unknown messages received.

Among the most frequent, I seem to see a message with value 1024 decimal ($400 hex) most often.

What is message 1024? How should I handle it?

From looking at the rest of the message data, it seems that msg[4] and msg[5] are a pointer to something. But what exactly is it a pointer to?

Using the sender-id in msg[1] and appl_search(), I find that it is usually sent to my application by Connect v2.46 and STZip 2.6 when they are starting up.

Ignoring it doesn't seem to hurt the overall functionality and stability of the system.

Is this message number documented anywhere?

Likewise, are there any other 'undocumented' messages I should be aware of?

I run a 20Mbyte TT with about 900Mbytes of online hard-drive, under TOS 3.05 and MultiTOS (with protection 'ON'). There's usually between ten and twelve megs of free RAM at the time those apps are loaded.

1962. Re: ICONIFY

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-24 00:00:00 UTC
From: msbaines@cix.compulink.co.uk
Message-ID: <DK3Jtt.H7H@cix.compulink.co.uk>
Source record: 10201

```
>I thought about introducing ICONIFY into some of my programs.
>Unfortunately I have very little documentation on the topic. A few
>questions :
First you need to include SMALLER in the window gadgets:

static int parts = (NAME | INFO | CLOSE | FULL | MOVE | SIZE | SMALLER |
UPARROW | DNARROW | LFARROW | RTARROW | VSLIDE | HSLIDE);

and an icon in your RSC file:
!rsrc_gaddr(R_TREE, FORM_ICON, &icon_form) ||

and then respond to the iconify messages in your evnt_multi loop:
case WM_ICONIFY:wind_get(msg[3], WF_CURRXYWH, &xc, &yc, &wc, &hc);
graf_shrinkbox(msg[4], msg[5], msg[6], msg[7], xc, yc,
wc, hc);
wind_set(msg[3], WF_ICONIFY, msg[4], msg[5], msg[6],
msg[7]);
wptr->iconified = OPEN; /*set a flag*/
break;
case WM_UNICONIFY:wind_get(msg[3], WF_CURRXYWH, &xc, &yc, &wc, &hc);
graf_growbox(xc, yc, wc, hc, msg[4], msg[5], msg[6],
msg[7]);
wind_set(msg[3], WF_UNICONIFY, msg[4], msg[5], msg[6],
msg[7]);
wptr->iconified = CLOSED; /*set a flag*/
break;

In your redraw window function (after moving etc) you need to either decide
whether to draw the normal window contents or the iconified window:

while (box.g_w && box.g_h)
{
if (rc_intersect(&area, &box))
{
clip[0] = box.g_x;
clip[1] = box.g_y;
clip[2] = box.g_x + box.g_w - 1;
clip[3] = box.g_y + box.g_h - 1;
vs_clip(handle, 1, clip);
if (wptr->iconified == OPEN)
DrawIconWindow(handle, box, wptr);
else
DoDisplay(handle, wptr);
}
wind_get(w_handle, WF_NEXTXYWH, &box.g_x, &box.g_y, &box.g_w, &box.g_h);
}
```

Draw your Iconified window. I use the same icon for all the windows and change the icon text label to indicate which window it is. You might also need to cater for different aspect ratios (ie effectively med res and all others):

```
v_opnvwk(work_in, &handle, work_out);
short aspect_ratio = work_out[4] / work_out[3];

void DrawIconWindow(short handle, GRECT area, WIND *wptr)
{
char *dest;
short x, y, w, h;

wind_get(wptr->whandle, WF_WORKXYWH, &x, &y, &w, &h);
dest = ((ICONBLK *)icon_form[ICON].ob_spec)->ib_ptext;
strcpy(dest, wptr->icon_text);
ClearArea(handle, x, y, w, h);
HideMouse();
icon_form->ob_x = x;
icon_form->ob_y = y;
icon_form->ob_width = w;
icon_form->ob_height = h;
icon_form[ICON].ob_x = w / 2 - icon_form[ICON].ob_width / 2;
if (aspect_ratio == 2)
icon_form[ICON].ob_y = h / 2 - icon_form[ICON].ob_height;
else
icon_form[ICON].ob_y = h / 2 - icon_form[ICON].ob_height / 2;
objc_draw(icon_form, ROOT, MAX_DEPTH, area.g_x, area.g_y, area.g_w,
area.g_h);
ShowMouse();
}
```

I don't bother with ALL_ICONIFY as it's a bugger not worth the effort IMHO. Hope that makes sense and helps!

It is doubtfull I am afarid, I send it to the editor of the zine, he
then releases it to such pdls as floppyshop, goodmans etc, I cannot
upload with this software so, your best bet is the pdls, theres 4 isues
of WARP and they are all Public Domain,

Dunno what just that message does ('d have to look up). It's probably
requesting if your software knows about some protocol. Since your
application doesn't know it should ignore the message.

> Ignoring it doesn't seem to hurt the overall functionality and stability
> of the system.
>
That's how it works : No response just means the receiver does not
support that specific thing.

> Is this message number documented anywhere?
>
Sure, read the docs of this particular protocol. ;-)

> Likewise, are there any other 'undocumented' messages I should be aware of?
>
Unless you wanna implement things like VA-protokoll, or Drag'n Drop you
don't need to know about those.

Why does it have to be in the bootsector ? A normal (small) program being physically (!) the first file in the main directory should do just as well.

Cheers Peter

Reuters, making loads of money on contract...

> Q Q Is there anyone out there programming,?

You should see my mailbox....loads of people.

> Q Q What are you programming,?

I've just released CLAv3 (electronic CAD & simulation).
I've got a new release of DUftp (mint-net again) almost ready.
XaAES (although a little late - sorry) is coming along nicely, and I
do promise to actually let a select few get their mits on it RSN.

> Q Q When will it be ready?

see above.

> Q Q Q What machines is it aimed at?

Well, DUftp is an 'any with MiNT+MiNT-net'
CLA runs on anything, but better in high-res/loads of colours (I wrote
it on a falcon).
XaAES has only been tested on a falcon so far, but should run on any
machine with MiNT.

> Q Q What type of release? ie pd etc

CLA is shareware (I've been working on it for 5 years now of and on).
DUftp is PD (I did a source release of it as well).
XaAES will be released under the GNU Public License as source & binary.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

I have a beta version of Telnet that is almost ready for release, but I
am looking for beta testers. I'd like to know what the Atari community
thinks before I upload it to all the various sites around the world.

So, if you want to have a copy, there are two terms to the contract:

1) You _must_ tell me what you think. Please e-mail me at jbaumgar@coil.com
2) Don't distribute it yourself. I realize that no security precautions
have been taken by me, but please don't. I only want people who are
interested in beta testing to use it for now. There will be an official
release available in a week.

The file is located at http://www.coil.com/~jbaumgar/ai.html

Thanks!

Fetched that release, and tried to run it. Directly after startup NVDI tells me "Invalid handle". Two choices : "Continue" or "Tolerate", one crashed immediately, the other later on. CLA obviously relies on the effect of Atari-VDI that wrong handles don't neccessarily lead to problems (Mind you : This is a bug !)

The plain computer of course does run it, but CLA involves lots of graphics, and this is painfully on a 12 MHz maschine without NVDI. I'd try CLA again, when the improper VDI handling is cured.

> I've got a new release of DUftp (mint-net again) almost ready.
>
I liked very much the idea of DUftp. I must point out that I really like the way Xwindow window manager display the GUI. And I also like the appearance of GEM. But mixing it up (like having a program with Motif look running in a GEM environment) is to me as ugly as almost nothing else. Please, Craig, go a little bit more for the style guidelines. I'd love to have a program like DUftp with a decent GUI. Is the gui hardwired into DUftp ? Or is there a way to cure this ?

> XaAES (although a little late - sorry) is coming along nicely, and I
> do promise to actually let a select few get their mits on it RSN.

I's love to check this one myself.

Please, Craig, don't take my critique personally, you've done a great job, but without people citicising programs hardly get better.

Cheers Peter

These are defined as such in my Lattice C header files. It is SMALLER in The
Atari Compendium.
I did wonder at the reasoning behind 'SMALLER' TBH ;-)

>Anyway, thanks a lot for your source code.
No problem. Hope it helps. Email if you don't understand anything.

1978. Cheap Jaguar Dev. Kit.

Newsgroup: comp.sys.atari.programmer
Date: 1995-12-31 00:00:00 UTC
From: roine@stacken.ct.se
Message-ID: <ftn_2.204.219_0e6cdaf0_Roine@stacken.ct.se>
Source record: 10217

```
-------------------------------------------------- 951231
Info about the Jaguar Server.
--------------------------------------------------
Current hardware revision B.
BootROM B001, JagOS version 1.07

A | in front of a line means that some new stuff
has been typed in there since the last info file...
--------------------------------------------------

The Jaguar Server project started out in August '94. The goal
was to make a cheap developer kit for anyone that wanted to
program for the Jaguar. Atari's own developer kit was $5500 and
that was WAY to much if you just wanted to hack and program the
Jaguar just for the fun of it.

The very first prototype was built around the Mega ST's 'MegaBus'
All of it was hand wired together using a total of 21 IC's.
I can tell you that this board had VERY little empty space on it..
This prototype was soon scraped, as i begun work on the Rev A
board, using a different approach this time. It was built for the
cartridge port and could then be used on all Atari computers not
just the ones having a 'MegaBus'.
To keep the cost down, i also decided to use the Jaguar's 2MB
main memory and not include any expensive RAM chips in the Jaguar
Server hardware.

The Rev A board was up and running with very simple software in
Februari '95. As the Rev A board had some small flaws, i made
some changes to the layout and came up with the Rev B board.

More serious work now begun on the Software - The Shell running
on the Atari computer and the JagOS - Running on the Jaguar.

--------------------------------------------------
General Info.
--------------------------------------------------

* Use the Jaguar Server kit to develop Jaguar programs !

* The Jaguar Server runs on all Atari ST/STE/Falcon/TT computers.

* The hardware plugs into your computers cartridge port. From the
cartridge hardware goes a 40 pin ribbon cable into the Jaguar.

* Uses a slightly modified standard Jaguar. You send our Jaguar
to me for modification, and i'll send it back to you.
```

* You can change betweeen 'modified' and 'orginal' Jaguar by the
flick of a switch. A reset button is also installed.
ABSOLUTELY _NO_ compability problems with Jaguar games.

* No programing restrictions apart from a 2Mb main memory limit
in the Jaguar. Future software updates will be able to upload
data at the command of a running Jaguar program.

* You use the Jaguar Server software to upload programs/data to
the Jaguar. The software looks best in resolutions over 640*400.

* Software updates to JagOS (Jaguar Operating System) are possible
without burning a new EPROM chip simply by using newer software.

| * Upload transfer rate is currently 83 Kbyte per second on a 8 Mhz
| Atari and 131 Kbyte per second running at 16 Mhz.

* Use the Devpac 3 assembler or any other code generator to write
programs.

* A remote debugger is under development.

* Software updates and info are availible on InterNet World Wide Web
at http://www-und.ida.liu.se/~t94patsa/jserver.html
and by filerequest with any FidoNet compatible mailer to
STacken BBS on FidoNet 2:204/219 under the magic name JSERVER

* A Jaguar Server Developer Mailing list are availible for
programming discussions. NOT open for anyone.
E-mail to nat@zumdick.rhein-main.de for more info

* The Jaguar Server development kit contains this...

+ Jaguar Server cartridge (hardware)
+ Jaguar Server Shell & JagOS (software)
+ Switches, ribbon cable, connectors and everything else
that you need to start programming right away.
+ A few Jaguar (*.JAG) programs and example source code.

* IT DOES _NOT_ CONTAIN THE FOLLOWING... You have to get these
things yourself....

- No 68000 or Atari RISC assemblers.
- No Jaguar technical documentation.

* 'Hacker' experience and good knowledge of assembler programming
is STRONGLY recommended because of lacking Jaguar technical
documentation.

* The Jaguar Server is NOT connected to Atari Corp. in ANY way.

* _Introduction_ price is :

3400 Skr
| 730 DM
| 330 GBP

```
| 510 USD for the Jaguar Server and a new Jaguar console
(Swedish PAL without game!), modified and ready
to be used directly.

1500 Skr
| 325 DM
| 145 GBP
| 225 USD for the Jaguar Server and modification.
You send your Jaguar to us...

Shipping is NOT included in these prices and will be added!
Around 200 Skr for shipping is normal.

------------------------------------------------
Some technical info.
------------------------------------------------
A Jaguar (*.JAG) program is built around a header. There are
currently five different headers, each with it's own use
and advantages depending on the development environment and
programs.
For example, one of the headers looks like this (for Devpac 3)

*---------------------------------------------------------------*
* Standard JagOS 3 Upload & Run parameters. *
* ? Roine 950420 *
*---------------------------------------------------------------*
OUTPUT i:\*.JAG * Output standard Atari Executable.

down EQU $5000 * Download adress in Jaguar.
start EQU $5000 * Program start adress in Jaguar.
OPT D- * No debugging info.

dc.b 'JAGR' * Magic to skip Devpac Header.
dc.w 3 * JagOS 3 - Recive & Run.
dc.l down * Download adress.
dc.l c_end-c_start * Lenght of Jaguar Code.
* A dc.l 0 are also possible.
dc.l start * Start adress.
ORG start * If position dependent code.

*---------------------------------------------------------------
c_start * Jaguar code start.....
NOP
NOP
ILLEGAL * Not much of a program... Hmm...
c_end * Jaguar code end.
*---------------------------------------------------------------
END

------------------------------------------------
Jaguar Modification
------------------------------------------------
As there has been some trouble with users installing things wrong when
```

modifying their Jaguars to accept the Jaguar Server Development kit,
I have decided to NOT to let users do this modification on their own
any more.

I really think that this solution is the best for both parts.
This means that the Jaguar Server Development kit will work when you
get it, just plug it in the computer and start programming and i will
get happy customers with working kits!

This means that you now _MUST_ send us your Jaguar console and i will
do this modification for you. This will ensure that the modification
is correctly done and working 100%
It is also possible to order a complete new Jaguar Console (PAL) if
you for some reason cant send your Jaguar to us.

Misc Info.

If you have more specific questions or want to order,
write me by E-Mail...

From: guy@swampdog.demon.co.uk
Message-ID: <820766356_OASIS_@swampdog.demon.co.uk>
Source record: 10219

Bah!

I've just spent the whole night debugging some code only to find shellsort() had failed. Is there a size limit for this function (32/64k?) or is my implementation of it broken (MWC 3.0.9). Replacing it with qsort() removed the fault immediately (duff addresses into the comparison routine no less!).

TIA

Fraggin' heck!

I apologise for that it was supposed to attach a file not quote
to kingdom come...

Very sorry!

What was supposed to go out was a plea to ANY Atari ST Doorgame
authors either past or present to send me info on their products
so I can compile a list of currently available doors available
to sysops like myself... What I am trying to do is sort out which
doors are still supported, which aren't, and update people on the
location to send donations too.

If you are/were a door author please drop me a line with:

>< Doorgame(s) along with last/latest revision number.
>< Shareware Status (expired/no longer supported/donation amount)
>< Your Name
>< Support BBS Number (if applicable)
>< Your Address if you are still accepting donations/support.

Thanks...

If I remember correctly, shellsort() is a recursive implementation, and therefore can require a significant amount of stack space, depending on the number of elements to be sorted. With MWC you by default get a limited amount; you can increase it by setting a global in your program (I forget the name, something like _stacksize). Since by default MWC doesn't check for stack collisions, your data and stack segments probably collided. Not pretty.

qsort() is not a recursive algorithm, so it doesn't have the same space requirements even though it has the same calling convention. I don't know for sure which is faster on MWC.

That would of course depend on your implementation.

>>(32/64k?) or is my implementation of it broken (MWC 3.0.9). Replacing

Shell sort, if correctly implemented, works, naturally. It wouldn't be
very useful as a sorting algorithm otherwise. ;-)

>>it with qsort() removed the fault immediately (duff addresses into the

>If I remember correctly, shellsort() is a recursive implementation, and

While it's perhaps possible to write a recursive shell-sort, that would
be very strange.

>therefore can require a significant amount of stack space, depending on

Shell-sort is actually one of those very nice sorting routines that
don't require any extra space (apart from a couple of integer variables).

>qsort() is not a recursive algorithm, so it doesn't have the same space

Quick-sort normally _is_ a recursive sort, although you could of course
write a non-recursive implementation. You'd still need some kind of
stack, though. The size of the stack would be proportional to log(n) IIRC.

I don't think the ANSI standard defines what kind of sorting algorithm
is actually used by qsort(). shellsort() is not an ANSI defined function.
Shell-sort and quick-sort are usually rather similar in performance.

The MWC manual says exactly the opposite - it's normally rather good.
The fact that qsort() worked and shellsort() did not, should have lead
me to that conclusion. I'll go check...

Unexpected result - No, it wasn't the stack :-(

Test code in shellsort() comparison module:

```
int
Cmp(a,b)
char **a,
**b;
{int dummy;

if ((long)&dummy <= (_stksize + 1024)) abort();
return strcmp(*a,*b);
}
```

I also increased _stksize to 128K just to double check. No joy.

Everything seems to work until the last comparison whereby 'b'
contains garbage - in fact the value looks like it could be the
consequence of a stack overflow. Wierd.

I'll have to try and duplicate it under more debuggable circumstances,
preferably with a file smaller than 300K!

I have the atari assembler editor cartridge. I have been trying to
figure out how to load the MSB and LSB into the accumulator using labels.
ex:

```
lda <NAME
sta XXXX
lda >NAME
sta XXXX
NAME .byte "Hello"
```

I have seen this wording in magazines, however I get an 'ERROR - 6' when
the assembler runs through 'lda <NAME'. Does anyone know the correct
syntax to use for this?

qsort *is* a recursive algoritm. But stack requirements may vary according
to implementation.

More precisely a textbook description of Quick Sort is recursive. This
does not mean that implemented as a qsort() function it has to be done
that way. Actually it is pretty easy to make it into an iterative
loop. This means that you have to maintain your own stack explicitely
but, with a properly done qsort(), on 32-bit machine you need something
like 16 cells long array of pointers (give or take a pointer or two)
for that purpose. A "naive" qsort() implementation is very good, and
important too, for a Computer Science 101 course but not for a decent
library.

I have no idea how qsort() is done in MWC libraries.

The manual says recursive. There is no source code provided for either
method which is a shame. I wouldn't mind seeing some though. If I'm
going to looking at the machine code then a basic idea of how they
both work will certainly help!

Quick sort is conceptually very simple:

- If there's only one element, the list is sorted, otherwise:
- Select an element, for example the first one
- Divide the rest of the elements into two groups,
one for values that are larger than the selected one and one for those
that are smaller (it doesn't matter where the ones that are equal go)
- Quick sort each group (by applying these steps recursively
- Put the two (now sorted) groups back together, with the previously
selected element in the middle
- The End!

Implementing this is a lot easier in some languages than in others.
C is one where it's not entirely straight-forward, so I'll skip that.
Let's leave it as an exercise for the reader. ;-)

Shell sort is far from as simple to explain, so I'll just give a working
example for you to examine.

void swap(int *a, int *b)
{
int tmp;

tmp = *a;
*a = *b;
*b = tmp;
}

/*
* This code is a quick conversion from a BASIC program
* => The array starts with element 1
*/

void shell(int *d, int n)
{
int inc, l, ps;

inc = n; /* lots of variations */
while (inc > 1) {
inc /= 2; /* lots of variations */
for(l = 1;l <= n - inc;l++) {
```

```
if (d[l] > d[l + inc]) {
swap(&d[l], &d[l + inc]);
ps = l - inc;
while ((ps > 0) && (d[ps] > d[ps + inc])) {
swap(&d[ps], &d[ps + inc]);
ps = ps - inc;
}
}
}
}
}

void main(void)
{
int elements[17] = {0,2,6,3,7,2,9,1,2,7,4,4,2,6,0,2,1};
int n;

shell(elements, 16);

for(n = 1;n < 17;n++)
printf("%d ", elements[n]);
printf("\n");
}
```

I hope that helps.

As I see it, 'C' problems comes in three flavours:

1) System related (in this case TOS etc). c.s.a.p will be the best group to hang around no matter what language you are using.

2) Compiler related (Lattice x.xx). Hmm .. Lattice has a product for the Amiga as well, but I still think that if you use an atari then c.s.a.p would be appropiate for questions and opinions on programmingtools.

3) 'ANSI-C' related. GOTO comp.lang.c.moderated

Yes, there definitely *is* a nasty bug in Mark William's shellsort()
that limits the effective array size to (IIRC) about 32 K: after
calculating the offset of an array element (using the `muls' operation),
the resulting value is sign extended to 32 bits - which is utter
nonsense, since `muls' already returns a 32 bit value!

One way to fix it: extract shellsort.o from libc.a, find exactly four
occurences of the sequence
0x48c0 ext.l d0
0xd08d add.l a5,d0
and, using some kind of hex editor, replace the `ext.l d0' by
a `nop' (0x4e71)...

I tracked this down a few years ago when a user of a file selector
I was hacking/maintaining at that time complained about crashes
when opening directories containing more that 1000 file entries... :-)

Strange. I've not had that problem myself, and I use NVDI all the time. I did try to ensure things worked OK (and did have quite a large number of testers with various setups from a 1Meg STE through falcons & TT's, right up to a PowerMac with MagicMac), and no-one had reported it. Oh well....perhaps you should have mailled me a bug report?

> The plain computer of course does run it, but CLA involves lots of

When used with NVDI or Enhancer, CLA3 speeds up a lot as it makes use of off-screen bitmaps to speed up the display.

> I'd try CLA again, when the improper VDI handling is cured.

Sigh...

> else. Please, Craig, go a little bit more for the style guidelines.

?????I'm sorry, but I don't follow you here. The only thing about DUftp that isn't quite standard is that the scroll bars are on the left for the remote & local file lists. Everything else is modern standard GEM. A menu bar, a couple of non-modal dialogs, one or two editable text fields, a pop-up menu or two....nothing non-standard about that. The drag & drop handling is standard as well...it's certainly nothing like Motif.

> I'd love to have a program like DUftp with a decent GUI. Is the gui
> hardwired into DUftp ? Or is there a way to cure this ?

I know the GUI isn't perfect, but it's not that bad. Better give me some real examples here, as I don't see a problem myself.

> Please, Craig, don't take my critique personally, you've done a great
> job, but without people citicising programs hardly get better.

Not personally, but at least in the case of the DUftp comments, puzzling.

Right here. There's a few of us about :)
DUftp was written in Lattice C (I think it's just about the only bit of
MiNT / MiNT-net software that has been so far). CLA is also done with
Lattice, as is XaAES.....

Craig
(using Lattice 5.52 on a falcon030 to write XaAES)

MiNT supports alternative filesystems; there is indeed a MinixFS which supports long filenames. IIRC, the latest MagiC (v4) supports loadable filesystems too (?)

Good luck,

This may be a red herring but ...

I have had this NVDI message crop up on occasion. Nearly all the time,
it can be duplicated, indicating a bug. However, on a very few
occasions, it can occur in normally well behaved software (no I can't
think of any examples - sorry!). I have a gut feeling that the cause
is some other software (maybe not releasing handles - dunno).

Hi !

Could anyone tell me, how to install an alternative filesystem on harddisc that supports long filenames and an unzipper to unpack Gnu C properly ? With my current setup, some files are overwritten during extraction.

I heard something about newer GEMDOS supporting such filesystems and a filesystem called minix, but I don't know exactly what this is all about.

Any help would be appreciated.

Hello,

a friend of mine got 2 hard diks from PC. These disks are SCSI disk, Prodrive LPS 120 and 340 from Quantum.He's working with Hushi scsi tool and can read sectors, verifie these but can't partitionnig nor installing a bootsector. It seems that these disks are low-level formatted, and that he can't do nothing.

Does anybody know a solution for this problem?

Regards.

Did they work when they were last used on the PC - and if so - what O/S were they used under?

I'v had no problem moving drives from PCs onto Ataris and back again. Whichever the drive is connected to - I can happily format and partition it.

This is using ICD Pro Utilities on a TT. Its a couple of years old now - but has useful features like being able to change the interleave. I had a drive on my PC with an interleave of 7 - and couldn't find anyway of changing it (actually only when I connected it to the TT did I find out that it was the interleave which was making it so slow). Anyway I had no problems formating and paritioning it using the ICD Pro Utilities - and after a DOS FDISK - the drive is now happily back up and running on the PC.

:-)

Roland.

Some drives need arbitration, meaning the computer has to identify itself with
its own SCSI-Id when requesting data. Since the TT is the only Atari-computer
with a proper SCSI-interface, this problem should only occur on ST-computers (I
don't know about falcon) when using disks via ACSI-port, because ACSI works
without arbtitration. But it seems strange to me that you can read sectors. On
which Computer does your friend run his drives ?

I am trying to create a simple cooperative multitasking system in Forth on the Ste. This is for a game. I am running into a problem whenever my multitasker trys to define a paramater stack (sp...a7) for an individual task. I am assuming that there are some pointers in the first 1k of memory, in the St, which determine the upper and lower limits for a data stack using a7. I have not been able to determine the proper way to change this address register without generating a bus or address error. I do not have any docs. Help.

No, there aren't. The stack can go as far as the memory reaches.

> change this address register without generating a bus or address error. I
> do not have any docs. Help.
>
Well, if you got an address error, the reason is obvious : You stored an
odd address into A7. Bus errors are generated on a few occasions. These
are :
- You accessed memory that's not there.
- You accessed the lowest 2 K in memory while in user mode.
- You accessed the I/O area ($fxxxxx) while in user mode.
The words "You accessed ..." may very well mean that you've set A7 to
one of the mentioned addresses and led the program do some stack work.

Note also that the OS does stack access as well. So try to make the
stack larger (try at least 4 K). Maybe you even have to save and restore
A7 for each OS access.

Good luck Peter

From: mrnmrs@io.org
Message-ID: <4d63v1$41t@ionews.io.org>
Source record: 10054

Anybody have any tips for this one. I've successfully captured the horizontal interrupt for the purpose of changing colours from scan line to scan line, but now I need to use the vertical interrupt to 'reset' my routine at the top/bottom of each screen redraw.

Unlike the horizontal interrupt, there doesn't seem to be an interface for capturing the vertical int.

I am working on a bog standard STFM.

Any comments/help is appreciated.

There's the deferred vertical blanking handler:

$452 vblsem short
$454 nvbls short
$456 vblqueue long

If this is of any use and you know C then email me - I have some code
to make use it.

Talking to myself again.

My mutitasker is now fully operational and enhanced.

Included is a nifty word called ?start

flag ?start task-name word-to-execute

if flag is true, then ?start sets the task to execute that word
if flag is false, does nothing.

Must now see if my implementation of local variables works with all of this
other stuff. I don't see why not.

"Stack Format Error"

The Motorola 68010 processor changed the stack frames created by TRAP and some other instructions. This "new" stack frame format carried on through the '020, '030, '040 and, I surmise, the '060.

A 16-bit "Stack Frame Format Word" is placed on the stack following the SR and PC registers. So, instead of a 6-byte TRAP frame, it is now eight bytes.

The new stack frame will only affect software which is either unaware of this change and alters the stack frame, or software which calls TRAP routines from the 68k Supervisor mode.

The CPU will "spit the dummy" if, when executing an RTE instruction (or one of a few other instructions which I can't seem to recall at the moment) to return from Supervisor (System) mode to User mode if this value is incorrect. It does so by executing exception number fourteen, which, in the case of Atari TOS, has been set to print a stream of bombs on the screen, the number of which tells you which exception was raised. Atari TOS also defaults to killing the process which raised the exception.

Source record: 10060

Hello,

Does anyone know how I can turn off the screen & the HD on my stacy by
software?
If you know how to do it, please send me assembler, pascal or modula-2
source or some hints!

Maccel has this feature, but I need to have finer control to this.
Are there some new TOS calls in stacy TOS? And how can I check for the
availability of these?

thanx,

Simi

I'm amazed that you've grabbed the hbl and not found a way of grabbing the vbl, or do you not have any docs at all? Even so, a little bit of hacking will soon sort that out. Anyway, here's a little snippet of code. Email me if you want some code examples - I'll send some hbl (done via the mfp), vbl, with screen-buffering and music source. Whatever else I've got lying around.

The vertical blank interrupt vector is located at $70. Just save this one and bung in the address of your new routine and there you go. Here's some code that rasters the screen in bars of colour. (The bars are made up from black->white->black.) The second vbl routine will make them move upwards. Wow! This isn't a very good way of doing things really. Much better to use the MFP if you want to change lots of the palette, and keep it that way for a number of scanlines. Eg: a score panel at the bottom of the screen could have a different palette to the rest of the screen. But the MFP isn't that good at changing lots of scanlines (Say you want fifteen differently done scanlines one after another) and basically falls back to becoming like the hbl. In actual fact, the hbl is controlled via the MFP, but the $120 vector gives a nice easy way of doing something every scanline. The MFP wins overall though because it uses less processor time overall compared to going through the $120 vector, although it may require a slightly different mode of attack. Email me if you want some MFP sources, or get out your disassembler and start hacking any demo, nicely done menu, etc.

Sorry about the crap spacing, but it's this editor's tabs.

```
;
; Some code for rastering the screen
;
... ; start code
lea.l colours,a6 ; a6->colour table
move.w #$2700,sr ; stop interrupts
move.l $70.w,old_vbi ; save old vbi vector
move.l $120.w,old_hbl ; and the hbl
move.l #vbl1,$70.w ; non-moving rasters
move.l #hbl,$120.w ; hbl interrupt
move.w #$2300,sr ; start interrupts
loop
cmp.b #39,$fffffc02.w ; space?
beq.s loop
... ; exit code here
;
; This'll give a display of rasters that is steady
vbl1
```

```
lea.l colours,a6 ; a6->colour table
move.w #1,vbl_flag ; flag the vbl's happened
rte
;
; This'll give moving rasters
vbl2
move.w #1,vbi_flag
rte
;
;
hbl
move.w (a6)+,$ffff8240.w ; next colour
cmp.w #$ffff,(a6) ; end of table?
bne.s hbl_end
lea.l colours,a6
hbl_end
rte
;
colours dc.w $0000,$0111,$0222,$0333,$0444,$0555,$0666,$0777
dc.w $0777,$0666,$0555,$0444,$0333,$0222,$0111,$0000
dc.w $ffff ; end of table
old_vbi ds.l 1
old_hbl ds.l 1
vbi_flag ds.w 1
```

2025. Gnu C++ setup problems

Newsgroup: comp.sys.atari.programmer
Date: 1996-01-16 00:00:00 UTC
From: David White <david.white@rd.eng.bbc.co.uk>
Message-ID: <4dfsm6$s6l@bbcnews.rd.bbc.co.uk>
Source record: 10064

I've found the excellent-but-massive gnu-st.txt file (I have probably got the name wrong). It explained several environment variables that need to be setup (GNUINC GNULIB GXXINC TEMP, etc) for the gnu 2.x compiler which I am trying to install. I wrote a small trial c++ program (called trial.cpp) that included the <iostream.h> file but it wouldn't compile.

On running the compiler with the -v switch (verbose) I found that it was not looking where the GXXINC variable indicated. Can anyone throw any light on this problem?

2027. Serial Port (850) Programming

Newsgroup: comp.sys.atari.programmer
Date: 1996-01-17 00:00:00 UTC
From: askwersk@mit.edu
Message-ID: <askwersk-1701960450550001@yavin.mit.edu>
Source record: 10066

I'm trying to work on the serial port.

I have a little program:

```
10 DIM A$(50)
20 OPEN #1,7,0,"R1:"
30 PRINT #1,"AT"
40 CLOSE #1
50 OPEN #1,6,0,"R1:"
60 INPUT #1,A$
70 PRINT A$
80 CLOSE #1
```

It breaks with:

ERROR- 135 AT LINE 30

When I change the 7 in 30 to 13 then instead it says..

ERROR- 154 AT Line 60

I cannot even find 154 in the error code listings. Can someone please explain to me how to send and recieve to a modem connected to the 850 interface?

I used to program on an 800 but it broke, then I bought an cheap used 800xl and an 850 interface but the previous owner forgot to include the 850 docs.

2031. Re: help - capturing the vertical interrrupt(not the horizontal one)

Newsgroup: comp.sys.atari.programmer
Date: 1996-01-18 00:00:00 UTC
From: gjones@cs.man.ac.uk
Message-ID: <4dle5h$ipn@m1.cs.man.ac.uk>
Source record: 10070

Oops, made a mistake in my last piece of code - should have been $68.w
not $120.w I only realised last night. Sorry about that. But I was doing
it from memory and haven't coded for a while. Might as well give a brief
info on the MFP since it's better than $68.w.

Ok, the MFP is the Multi-Function Peripheral chip and controls the timers
and serial port and some other stuff. The timer vectors are all located
around $100-$150. The hbl ($68.w) is in fact an extension of the MFP, but
runs every scanline, rather than being programmable as the MFP is. So,
how do we take control of this? Simple, let's jump to your interrupt
install code:

```
... ; your start code here
move.w #$2700,sr ; stop interrupts
bsr save_ints ; save all the interrupts
move.l #vbl,$70.w ; new vertical blank
move.l #timerb,$120.w ; new timer b routine
move.w #$2300,sr ; start interrupts
loop
cmp.b #$39,$fffffc02.w ; space?
beq.s loop
move.w $2700,sr ; stop interrupts
bsr restore_ints ; restore all the interrupts
move.w #$2300,sr ; start interrupts
... ; your exit code here
```

Ok, let's take a closer look here. You turn off the interrupts first
since you don't want them still going whilst you're installing new
interrupts as the results can be unpredictacble. You save the
interrupts (this means the vbl, hbl, and the MFP interrupts you use
in your routine - we're getting to that bit). So here's the vbl rout:

```
vbl
move.w #1,vbl_flag ; flag it's happened
clr.b tbcr
move.l #timerb,$120.w ; new timer b
move.b #1,tbdr ; start in 1 scanline
move.b #8,tbcr ; event countdown mode
rte
```

Ok, this first stops timer b, installs the new routine, then sets the
timer b data register to 1, then starts timer b using 8 as the
control number - this is event countdown mode. In this mode, each
scanline the data register gets decremented by 1, and then the new
routine is run when it gets to zero. Here's the hbl rout:

```
timerb
clr.b $fffffa1b.w ; stop timer b
```

```
move.b #100,$fffffa21.w ; 100 scanlines (tb data reg)
move.l #tb2,$120.w ; new tb rout
move.b #8,$fffffa1b.w ; event countdown mode
addq.w #4,$ffff8240.w ; a simple colour change
blcr #0,$fffffa0f.w ; acknowledge interrupt
rte
```

Ok, take a look at the above. Hopefully you'll understand most of it. The idea is simple - stop the timer, set it's data register, put the address of the next routine to use, start the timer. BUT, you need to also acknowledge that you've finished with the interupt as well, otherwise the channel is left open and is unusable. Ok, here's some more code.

```
tb2
clr.b $fffffa1b.w ; as above
move.b #4,$fffffa21.w ; 4 scanlines
move.l #tb3,$120.w ; new rout
move.b #8,$fffffa1b.w ; start timer
clr.w $ffff8240.w ; black background
bclr #0,$fffffa0f.w ; acknowledge
rte
tb3
clr.b $fffffa1b.w
move.b #4,$fffffa21.w
cmp.w #$0007,$ffff8240.w ; best blue?
beq.s tb3_dn ; yes, so we want to go down
move.l #tb3,$120.w ; this rout again
move.b #8,$fffffa1b.w
addq.w #1,$ffff8240.w ; brighter blue
bclr #0,$fffffa0f.w
rte
tb3_dn
move.l #tb4,$120.w ; down rout
move.b #8,$fffffa1b.w
subq.w #1,$ffff8240.w ; start going down
bclr #0,$fffffa0f.w
rte
tb4
clr.b $fffffa1b.w ; same as tb3, except
move.b #4,$fffffa21.w ; we're going down the
cmp.w #0,$ffff8240.w ; blues
beq.s tb4_up
move.l #tb4,$120.w
move.b #8,$fffffa1b.w
subq.w #1,$ffff8240.w
bclr #0,$fffffa0f.w
rte
tb4_up
move.l #tb3,$120.w
move.b #8,$fffffa1b.w
addq.w #1,$ffff8240.w
bclr #0,$fffffa0f.w
```

rte

Can you see what the result will be? Examine the code, and run through a few cycles of it. Draw diagrams if they help, I find them invaluable. Ok, let's go through it - we start with a black background (at tb2), then run tb3 after 4 scanlines. tb3 stops the interrupt as normal, then checks to see whether the blue has a value of 7 (highest my STFM can cope with!) If it is 7 then it jumps to tb3_dn. We'll deal with that in a moment. Otherwise, it adds 1 to $ffff8240. This actually increases the blue amount in the colour. (for colours, use $RGB, where R=red, G=green, B=blue, eg: $0333 = a grey, $0777=white, etc.) Then it acknowledges and runs the next timer b, which is in fact itself. So now we get a brighter blue, and etc... so we end up with a fade of black to blue. Now we get to tb3_dn, which decreases the amount of blue and runs tb4. Guess what that does eh? This is a pretty poor example of the MFP, but you get the idea. This could have been coded differently, in one timer b, using self-modifying code, where the addq is changed to a subq or vice versa. Ho hum. You may notice that the colours flicker slightly at the very edges of the line, this is because the exact moment the instructions are getting run is not the same every time. It is possible to avoid problems like this, and do special triclks (like opening the borders), but I leave that for you to find out (or hack!).

You can implicity declare where the includes are by option
-I/dev/g/path/to/g++-include
or simpy -I$(GXXINC). You propably have also to add -L(GXXLIB) for
properly linking.

A long time ago I had a copy of G++ 1.40 which worked in 2.5Mb. You need to run a seriously striped down system - and turn optimisation off. Even then you will be limited to the size of programs you can compile.

:-)

2035. Help, any MWC users?

Newsgroup: comp.sys.atari.programmer
Date: 1996-01-20 00:00:00 UTC
From: dzander@solaria.sol.net
Message-ID: <4dr562$khs@solaria.sol.net>
Source record: 10074

Hello, I am wondering if there are any Mark Williams C users who can help me with a problem I have. The manual doesn't explain how to use the LineA routines very well and contradicts itself with the header file. In the lexicon (MWC 3.0.5) it says that the instruction to place a sprite on the screen uses two pointers but the header file shows four parameters; two long (for the x,y position) and two pointers which I assume the first is a pointer to the structure la_sprite and the second is enough free space to hold the screen's background.

Another question I have is if I am able to combine VDI commands with the linea commands. When I open a virtual screen with opnvwk() and then use the linea0() (initialize) command I get a crash. I think I read somewhere that if a program uses line A routines then it cannot use the VDI nor the AES and must run as a TOS program with the .tos extension.

Thanks in advance for any help.

2036. Interrupts in C

Newsgroup: comp.sys.atari.programmer
Date: 1996-01-20 00:00:00 UTC
From: Jens M Andreasen <jens-and@dsv.su.se>
Message-ID: <Pine.ULT.3.91.960120083911.10983B-100000@mars.dsv.su.se>
Source record: 10075

How should I do to properly install an interrupt that outputs midi from a timestamped que? It should output the first element, check the time of the next, and "sleep" until that time.

I want my C application to calculate the times and (if nescessary) rearrange the que. This is no problem.

The problem is that whenever I try to install an interrupt, my system hangs or bombs out :(

Any example on installing interrupts in mixed C/assembly is most welcome!

I use Lattice C 5.06

> background.

There is quite a bit of contradiction throughout the whole of the
LineA documentation. To be fair, MWC did attempt to document what was
(and still is to a large extent) undocumented atari routines. On a
more helpful note:

```
linead()
int16 hot_spot_x, hot_spot_y;
struct la_sprite *p;
void *save_blk;
```

save_blk should be:

```
high rez 74 bytes
med rez 138
low rez 266
```

This needs to be calculated as 64 bytes per bit plane + 10 bytes just
in case the program is to run under unknown resolutions.

It's a long time since I did any of this so you will need to get out
the debugger and check the size of the parameters passed to linead().
At the machine level, the first two are ints but they *might* be int32
at the linead() function level. (Off the top of my head) You should
see something like this:

```
linead_ link a6,$something
move.w 0x8(a6),d0 /x pos
move.w 0xa(a6),d1 /y pos
move.l 0xc(a6),a0 /la_sprite
move.l 0x10(a6),a1 /save_blk
linea $0x000d
unlk a6
rts
```

ie check that 8(a6) and 10(a6) are in fact words, not longs.

If you plan to use the LineA often then I recommend getting more than one source of literature. All of them have errors. With three books you can just about work out where the errors are. "Compute's Technical Reference Vol 3" (the TOS one) is pretty good as far as they go.

> Another question I have is if I am able to combine VDI commands with
> the linea commands. When I open a virtual screen with opnvwk() and then
> use the linea0() (initialize) command I get a crash. I think I read
> somewhere that if a program uses line A routines then it cannot use the
> VDI nor the AES and must run as a TOS program with the .tos extension.

They can be combined but it is tricky. The basic problem is the AES and VDI treat the linea like a slave - both have licence to write anywhere they want, so combination with your own linea code relies on your ability to to keep restoring the data, which negates the speed advantages of using the linea somewhat. You are essentially being a cut down VDI. Again, unless speed is crucial, I recommend sticking to the VDI.

In the end, I completely rewrote the LineA bindings and they are now much easier to understand. I even wrote some linea font loading routines. I'll email the lot if you want to take a peek at the source code.

Source record: 10078

Hi. I'm writing a number of programs in C with a nice modern GEM interface (windowed dialogues, iconify etc.), and I am currently using GCC. However, all my previous GEM programs have been written in Prospero C, which has a number of non-standard function calls. (eg. objc_newtext() and objc_text())

I have managed to work out an equivelent piece of code for a number of the functions, but cannot see how to write an equivelent routine to either of these two:

```
char *objc_text(OBJECT *tree,int index)
/* IIRC? Not sure... */
```

which returns the text field of the given object in the given tree. and...

```
void objc_newtext(OBJECT *tree, int index, char *text)
```

which changes the text field of a given object.

Any ideas on how to do this? (I tend to use objc_newtext() a lot to change the value of status indicators etc.)

Cheers

Anthony

I do believe that you can use rsrc_gaddr to find the address of the
object and then grab the address of the text string from the record
defining the object. You'll need to pass rsrc_gaddr the number of the
object you want to change. I can't recall the exact details of the object
structure though, so you'll need to look em up.

Very basically, it all revolves around a switch statement.

OBJECT *ob;
char *p;

rsrc_gaddr(R_TREE,tree,&ob);
switch (ob[obi].ob_type) {
case x: /* TEDINFO (ie text) */
p = ((TEDINFO*)ob[obi].ob_spec)->te_ptext;
break;

case y: /* STRING */
p = ob[obi].ob_spec;
break

etc ..

default:
p = NULL;
break;
}

return p;

>void objc_newtext(OBJECT *tree, int index, char *text)
>
>which changes the text field of a given object.
```

```
p = objc_text(ob,obi); /* or whatever */
sprintf(p,blah...);

/* assuming window is open, redraws all visible objects */
wind_update(BEG_UPDATE);
wind_get(handle,WF_WORKXYWH,PRECT(wr));
wind_get(handle,WF_FIRSTXYWH,PRECT(rr));
while (rr.w && rr.h) {
if (rc_intersect(&wr,&rr))
objc_draw(ob,obi,MAX_DEPTH,rr)
;
wind_get(handle,WF_NEXTXYWH,PRECT(rr));
}
wind_update(END_UPDATE);

Use this to size a single object and adjust the above redraw
accordingly ...

objc_offset(ob,obi,&rr.x,&rr.y);
rr.w = ob[obi].ob_width;
rr.h = ob[obi].ob_height;

You may have outside border problems because objc_offset() does not
take them into account. Depends on what you are doing really.

>Any ideas on how to do this? (I tend to use objc_newtext() a lot to change
>the value of status indicators etc.)

Using the redraw method ensures the objects are drawn correctly in the
background. You do not have to wait for a WM_REDRAW message before
walking the rectangles, it can be done at any time.

I assume from the function names that when you say "status" you are
referring to text. If you mean the state field then simply ...

ob[obi].ob_state &= ~SELECTED; /* clears selected */
/* redraw code above */

Perhaps something like this:

char *objc_text(OBJECT *tree, int index)
{
switch (tree[index].ob_type & 0xff) { /* Mask off extended byte */
case G_STRING: /* For all object types whose ob_specs point to a */
case G_BUTTON: /* string, do this... */
return (char *)(tree[index].ob_spec);
case G_TEXT: /* Ditto, for anything that has an ob_spec which */
case G_BOXTEXT: /* points to a TEDINFO structure, do this... */
case G_FTEXT:
case G_FBOXTEXT:
return ((TEDINFO *)(tree[index].ob_spec))->te_ptext;
}
return NULL;
}

> void objc_newtext(OBJECT *tree, int index, char *text)
>
> which changes the text field of a given object.

Pretty easy, given objc_text exists. Note there isn't any bounds checking,
I don't know if the Prospero version did any or what. (ie make sure your
new string doesn't overflow the space for the string in the resource.)

void objc_newtext(OBJECT *tree, int index, char *text)
{
char *s;

s = objc_text(tree, index);
if (s)
strcpy(s, text);
}

The call

objc_newtext(OBJECT *tree, int index, char *text);

should be aquivalent to

strncpy (((TEDINFO *) tree[index].ob_spec)->te_ptext, text,
strlen (((TEDINFO *) tree[index].ob_spec)->te_pvalid));

This line makes sure you don't write text too long into the field, but
does not check whether the string matches the validation string.

It depends with interrupt you wanna use. The most basic way is to switch
to Supervisor Mode, then save the old interrupt vector, so your routine
can properly return to the old routine, then write the address of your
routine into the interrupt vector, and return to user mode. If you want
to completely replace the old one, yours must end with an RTE
instruction, which is hard to achieve in C. The other version is very
tricky to do as well in C. For both I would strongly suggest to use
assembler, at least for the binding to your C code. The fiddling with
vectors in Supervisor mode can be replaced by a Setexc() call (this is
BIOS).
Easily done (even completely in C) is installing a vsync interrupt
function. This is because TOS provides an array where you can put the
address of your routine, and it will get executed as a normal subroutine.

Whichever way you choose : Note that your new interrupt will be executed
in Supervisor mode, and will also use the supervisor system stack, which
is very limited !!! There is very little space for local variables, and
virtually none for arrays or extended structures !

>
> I use Lattice C 5.06
>
I never used Lattice C, I've got no idea whether it provides any help
with such problems.

There is a Calamus modul available called "Bridge". This modul exports any Calamus file into a variety of different image formats including EPS und PS, you can even print on PS printers this way.

The TTM194 can be turned down to complete darkness, so you don't need a screen saver. The TTM195's brightness can only be varied in a limited range, but it seems to have a better contrast. I have seen only one example of each type, so I cannot tell you whether there are differences in contrast in within a production series.

Have you tried the manuals?
There's not very much info in there, but they do mention that you have to
use the __interrupt calling protocol modifier. Otherwise the function will
be terminated with an RTS rather than the RTE needed for interrupt routines.
I assume __interrupt also makes sure that all registers are saved.

For normal interrupt handling that should be enough, but the compiler also
supplies the interrupt function with a special structure so that you can
access the saved SR and PC (and other things, when available).

>a number of non-standard function calls. (eg. objc_newtext() and objc_text())
The sort of thing you want is this:
---
/*
* copy the string from a TEDINFO into another string
* usage: get_tedinfo(tree, FIELDNAME, edit);
* where: global OBJECT *tree; global char edit[40];
* and FILENAME is editable object in tree defined in RSC header
*/
void GetTedinfo(OBJECT *tree, int obj, char *dest)
{
char *source;

source = ((TEDINFO *)tree[obj].ob_spec)->te_ptext; /* extract address */
strcpy(dest, source);
}

and

/*
* copy a string into a TEDINFO structure
* usage: set_tedinfo(tree, FIELDNAME, edit);
* where: global OBJECT *tree; global char edit[40];
* and FILENAME is editable object in tree defined in RSC header
*/
void SetTedinfo(OBJECT *tree, int obj, char *source)
{
char *dest;

dest = ((TEDINFO *)tree[obj].ob_spec)->te_ptext;
strcpy(dest, source);
}

2056. ST's Timer A/B questions - need help for emulator

Newsgroup: comp.sys.atari.programmer
Date: 1996-01-25 00:00:00 UTC
From: S94 <gearyp@cs.man.ac.uk>
Message-ID: <310785C1.41C67EA6@cs.man.ac.uk>
Source record: 10095

I've been trying to figure out how these work for an emulator i'm doing.
What i need clarifying is this:-

When the counter is at 01, what happens on the next impulse??
- ST INTERNALS says somthing about changing the timer to the output of
it's pins ?, does'nt make much sense to me..
i presume it the resets the counter to it's original value ??, and
counts down again, or do you have to do this yourself??

secondly, what is the point of setting bit 4 of the control register to
produce a low reading. When exactly would this be useful and what
differences does it make.

Lastly, i've been running my emulator through the St's ROM (v1.0), the
code of this is also in ST INTERNALS which is helpful. I was wondering
what the code between FC0CE4-FC0D1E does, it's a small routine which
does what appears to be some mindless looping using Timer B, maybe
somone could enlighten me on that as well. I could always type the
routine in if nobody has reference to this book.

Thanks in advance, it would really help me if sombody could answer these
questions.

Paul Geary.

There are sometimes some compatibility problems with EPS formats. Therfore
I'd like to trythis utility.

What is FAST Club and how can I contact them ?

If I remember right there is a possibility to set the counter to
continuous or single-shot mode. The name says it all, I think. I'm not
sure though if the reset is done when the counter reaches 0 (as you
assumed) or when it goes negative (counting down from 0). I'd have to
look it up.

I use an STFM in medium rez. This is fine if you don't mind turning
off the options for pictures (switch on the option for text instead
though). It's also faster and less prone to crashing (imho).

: (Couldn't resist!)
Well, I sure like that disease! Yes, of course I do program APL - as
everyone will keep on doing once he/she has seriously begun to learn the
language. However, I own only an old version of APL.68000 for the ST. If
anyone is willing to sell an APL2 license for the TT, I�d be interested.
(If the price isn�t L100: that�s what MicroAPL wants me to pay...)

Nowadays, I�m using APL2 for OS/2.

Oh yes! :)
The manuals (5.06) mention how to do a normal function call, and thats it!

> There's not very much info in there, but they do mention that you have to
> use the __interrupt calling protocol modifier. Otherwise the function will
> be terminated with an RTS rather than the RTE needed for interrupt routines.
> I assume __interrupt also makes sure that all registers are saved.

My version of Lattice manuals (5.06) mentions that the __interrupt
modifier is legal but not doing anything (yet) :(

I have tried to inline an RTE , but I have this feeling that the startup
of the routine spoils the registers before I can tell it to save them all
(or at least the ones I intend to use.)

So the problem is how to do the bindings to the interrupt as an assembly
routine using the assembler included in the package.

Forexample: let an interrupt increment a global variable every milisecond,
and let the C routine access that variable {printf("%d",number);}
If I could come that far, the rest would be _much_ easier.

2072. Change top process under MultiTOS - how?

Newsgroup: comp.sys.atari.programmer
Date: 1996-01-27 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <4ece2l$foa@status.gen.nz>
Source record: 10111
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

I am trying to change the top process under MultiTOS. By "top process" I am referring to the process which has a tick on it in the desk menu.

So far, I just look through all the windows until I find a window owned by the process I want to top, then send a wm_top message to that process. This works ok if the process has opened windows, but not if it only displays a menubar and no windows.

Does anyone know of a universal way of "topping" any process, having the same effect as selecting that process in the desk menu by hand?

I have been trying to find an answer to this question for some time, but nobody seems to have any ideas :(Perhaps I have to use appl_tplay() to simulate a mouse click in the desk menu?? How would I go about finding out what position to click in the menu to choose the process I want?

Thanks for any suggestions!

Hi, just wondering if anyone can recommend to me ways to quickly get into programming for my Falcon. A friend and I are currently doing Amiga programs, and I'm eager to port some of these to Falcon (maybe STe where possible). I'm reasonably familiar with programming, but if you could all give me your (no doubt) differing opinions on which languages to use I would be most grateful. BTW, the games are basically 2D sprite/scrolling things.

Itching to start,

Jared

The question I have is how do I write a TSR which can link into an Interrupt in C?

When linking into the interrupts, is it possible to make the program both screen resolution and machine independant, ie. it will run on both an ST and a TT withoout to much effort in coding seperate sections for either machine.

All help on this issue is appreciated, especially any commented C source code giving examples ;-)

IMO you should use, on the Falcon, whatever language you have been using
on the Amiga. You will have enough bother converting system calls without
needing to learn a new lingo.

AFAIK all languages available on the Amiga are also available on Atari.

If you are REALLY FED UP with the language you are using on the Amiga then
start NEW projects with something else.

C seems to be the fave.

long time, but now I have installed a linux and gcc under linux runs
faster a bit and is also much easier to use and configure. I have also no
problem with getting the newest version (currently 2.7.2 --- exceptios
supported!) of compiler and debugger and I can make tos cross-compiler.
Its worth while.

regards,

Simon.

Since it seems like you know the basic fundamentals of programming...
Start coding in assembly NOW !!!! Later on start on C, and then combine C
and Assembly.. In this way you will learn the instructions from the
computers view, and learn how to increase the CPU preformence.. ;)

Get started in Assembly by reading the book :

Introduction to Atari ST Machine Code.. (or something like this)..

And then get other 680x0 books.. Then you will learn it in a good manor..

Greets Jakob :)

2085. Assembler Source code for interrupts in C

<SNIP>

I've knocked up this bit of code, which gives you a timer B timer vector that
simply increments the contents of a Global int. This code was written off the
top of my head, so as to wether it works or not, I make no warrenty.
As I don't have a C compiler I can't test it, so if it don't work you're
own your own ;)

In the code I'm assuming that the stack will look like this:

sp-12 int timer b data byte (0x000000db)
sp-8 int timer b control byte (0x000000cb)
sp-4 int address of global variable
sp-> int return address

when Install_TimerB is called.

Check out my page for mfp info.

There is no interupt that normally is being fired each millisecond or
even more often. You gotta setup an MFP timer and let that one cause
interupts. If this resolution is not needed though, it might be even
enough to use _frclock, which counts the frames displayed on the screen
(Rate depends on resolution set.) If you could use that one you won't
need any interupt programming at all.

Cheers Peter

2087. TOS 4.04 bugs?

Newsgroup: comp.sys.atari.programmer
Date: 1996-01-29 00:00:00 UTC
From: baldrick@terminator.rs.itd.umich.edu
Message-ID: <4eise4$l4m@lastactionhero.rs.itd.umich.edu>
Source record: 10126

I've encountered what seems to be a bug with TOS4.04, I was
wondering if anyone else had encountered it or could comment on it.

When programming a Desk Accessory and using the Windfind command
I get a return of -1. The same program on a TOS 4.02 machine returns the
appropriate window handle.

Comments? Suggestions?

Thanks,

Dan Ackerman
aka baldrick@terminator.rs.itd.umich.edu

Well, are you sure you supplied senseful coordinates to wind_find? As this
functions returns the handle of a window containing a given location on the
screen, it may return -1 if there is no window to be found.

I'm running TOS 4.04 myself, and I haven't experienced any problems with my
program Maus-Window, which uses wind_find extensively.

Ciao

I'm not sure about that, but there is a collection of documentation
available in english from a fellow in the US. It includes

- Pure C Help Files (in english)
- Complete documentation of Pure C menus, double clicks and hot keys
- Assembler and C Language references and tutorials
- Pure Debugger menus and window descriptions
- Complete descriptions of all library functions(except BGI, LineA,
and VT52)
- Atari Memory Map and hardware descriptions
- ASCII, Scan Codes, data structures, file formats, examples, & more.

He was selling this at $50 US, but put it on half-price sale around
Christmas. Maybe it's still on sale? You can reach him at

John Kormylo
9614 Oregano Circle
Houston, TX 77036

Or e-mail at J.KORMYLO@GENIE.COM.

It depends what programming language you are using now - if on the
Amiga, you code in C, then its probably best that you stick what the
programs are written in...

If you are using AMOS (do Amiga programmers still use this?) then you
might want to switch to STOS, and use my Falcon Extension....

>:and Assembly.. In this way you will learn the instructions from the
>:computers view, and learn how to increase the CPU preformence.. ;)
>
>which is necessary on the slow falcon?

Yes! As has been mentioned elsewhere, the bus is slow on the Falcon,
and to get anywhere near optimum performance in a decent graphics mode
you need to take this into account.

When the bus only has to handle 32k for a screen its not too bad, but
if you have 153.6k for a screen to update/draw every refresh it starts
to get overloaded...

Anthony

re: Windfind

I do a vq_mouse to get the position before the call. The really odd thing about this problem is that it occurs on this one machine in both it's normal TOS and under MultiTOS, while on the other machine it works fine under it's normal TOS and the same AES version of MultiTOS. It doesn't really make any sense.

#>and not on the other?
Well, I guess that's because the VDI in TOS 4.04 is less forgiving that that
found in older versions. (Remember: MultiTOS replaces the AES, not the VDI!)
Or maybe you've used NVDI on one machine, but not on the other.

But anyway: Don't mix AES- and VDI-calls for accessing the mouse. To get the
current mouse position, either use graf_mkstate or use the values returned
from an evnt_multi call (evnt_multi _always_ returns keyboard and mouse state,
independent from the events you have specified).

Also, to switch the mouse on and off, use graf_mouse(M_ON/M_OFF, 0L) instead
of v_show_c/v_hide_c (I know you haven't written that, but this is another
common problem).

Ciao

Thanks to everyone who's so far responded to me here, and via e-mail :)

At the moment, I'm most likely to go the C route. The games we've been doing are written in Blitz basic, with some in-line assembler (which I've been led to believe should be one of the easiest parts to convert), so I now have just a couple of other questions...

1) Are there game-type libraries around for various C-compilers to handle sprites, hardware scrolling, sounds and the like. If so, then will my choice of C compiler affect which libraries will work?
2) Not really another question I guess...Which C compiler (English language)?

Thanks again,

Jared

IIRC, wind_find should return 0 if no window is found (ie: the desktop)...?

2103. ltoa()

Newsgroup: comp.sys.atari.programmer
Date: 1996-01-31 00:00:00 UTC
From: guy@swampdog.demon.co.uk
Message-ID: <823158320_OASIS_@swampdog.demon.co.uk>
Source record: 10142

'ello,

I've got a slight problem - can somebody enlighten me about how ltoa()
works. I have to write one due to it being missing in my compiler.
Better still, if somebody has the source for one then get in touch!

This is all I know ...

```
char *ltoa( int32, char*, int16_or_32 );
char *ltoa(val,dest,oo_er)
```

It converts 'val' into a string and writes it to 'dest' right? Is
'oo_er' the precision, maximum string length or what?

TIA

Interesting theory ;-) Well, a double bus fault leads to zero bombs (just
halting the computer), so to this point the theory is right.

> 1 bomb = Reset
>
This one never occurs that way, it always directly restarts the computer.

> 2 bobms = Bus Error
> 3 Bombs = Invalid Instruction..
> and so on...
>
The latter is wrong :
3 Bombs = Address Error
4 Bombs = Invalid Instruction
8 Bombs = Privilege Violation

Cheers Peter

You shouldn't use VDI functions if equivalent AES functions do
exist; use graf_handle() in this case!

(Or, possibly even better: use evnt_multi(MU_TIMER) with a null
delay - there are reports about strange mouse button problems
if graf_handle() and evnt_multi() are *both* used in the same
event loop...)

>The really

>It doesn't really make any sense.

Yes it does... :-)

Probably it's a bug in the Falcon's VDI; note that MultiTOS doesn't
contain a VDI - it simply uses the existing one, which would nicely
explain your observation!

You are right on your first two assumptions,

oo_er is called "radix" in my (MS)documentation. It's the base you want the output written in ie: 16 for hex, 2 for binary, 10 for normal base 10

Unfortunately this function is non-standard and may do whatever ... Have a look at sprintf before wasting too much work!

oo_er is the `radix', so I guess you can also use it to make binary
(radix = 2) or hex (radix = 16) representations, for example.

When making your own, you can probably make use of sprintf().

Do you Lattice C?
If so, use stcl_d, stcl_h etc calls.

A null delay in evnt_multi() in a Desk Acc locks up the system under TOS 1.0. Not that I'm using 1.0, but I hate to write programs that will knowingly cause such problems.

But they are both using NVDI 2.5. The only functional difference between them under MultiTOS is that one has 14 megs and the other only 4.

Hi,

my PureC (1.0) is behaving a bit strange: I have a program that
combines C and M68K, and in both I declare some variables:

main.c: void *buffer[80][2][10];
fdrsec.s: .DATA
FDsector: dc.w 0

If I now link these modules together, I get that 6400 bytes have been
allocated for `buffer'--just as shd be--but FDsector (and other
variables I defined in fdrsec.s) appear somewhere inside this buffer!
In other words, suppose buffer points to 0x0000 and continues until
0x1800 (or whatever 6400 is in hex); then FDsector will point to, say,
0x0600. Clearly I get all kinds of problems with this.

Am I doing something wrong? (I checked everything I could possibly
think of.) Or is this some bug in PureC? And how do I prevent this
from happening?

Thanks in advance,

Hi,

I am having the following with a program I am writing to read/write Akai sampler disks, which are formatted slightly different from the Atari/MS-DOS format. I had to directly program the FDC--all (x)bios functions fail to read such disks--and finally got it working, but now I am experiencing the following problem.

When I, say, insert an Akai HD disk and try to read it from the desktop, I get `your output device is not receiving data'. When I run my program, it reads the disk just fine. However, if I now insert an Akai DD disk and run my program, it fails to read it at all--HD disks work fine though. If I try to read the Akai DD disk from the desktop, I get the same error message, but suddenly my program will read only Akai DD disks--HD disks aren't recognized at all.

In other words, it seems there is a problem switching between DD and HD. Attempting to read the disk from the desktop solves this, but how do I do this from within my own program? Any help would be much appreciated.

Thanks in advance,

-- Jules

Hi Ben....no, it's not really been delayed (much). I wasn't happy with
the performance of TOSWIN with it, so I'm cobbling together a replacement
console window before the beta (you cann't run a desktop yet so you need
the console to run programs from).

Does anyone know what MINIWIN does with it's resource file? It definitely
has one, but it never calls rsrc_load(), or any of the other rsrc_ class
functions for that matter - but it then goes on to call rsrc_gaddr() anyway.
Any offers?

Craig.

I've had my old STFM for quite a while, but this is a problem that has always been with it, and I've just learned to live with it. I'd like to fix it though so this is the problem - in medium resolution, and occasionally low resolution as well, pixels on the screen flicker uncontrollably. This makes text very difficult to read - for example, when using Monst2, I have to use the 'faint' command to reduce the text size otherwise bits of the text are unreadable. On bad days, even the faint text suffers from the flicker. The flickering is generally not individual pixels but more often lines of about 8 pixels with little dots around it. The Ultimate Ripper when I had it for a while was essentially unreadable, and doc displayers (eg Revenge) suffered the same problem. Once, after using the computer for a few hours, I suddenly noticed that the problem had disappeared. I originally thought it was probably a dodgy tv modulator since I use a tv, but, having made up a scart lead the other day, the problem was not solved. (although the display was noticably improved by the scart lead). I thought it may be a memory problem, but the screen ram is perfectly steady. Opinions anyone? I suspect it is the video shifter which is causing the bother. How much are new ones and what expertise is requried to fit it. (I'm alright with a soldering iron and have opened my ST up plenty of times to clean it or fix the damned mouse/joystick ports).

Hi,

Is there any release of XaAES around yet? I remember back in the start of
Jan that Craig said about two weeks - has it been delayed?

Thanks,
Ben

Source record: 10167

: At the moment, I'm most likely to go the C route. The games we've been
: doing are written in Blitz basic, with some in-line assembler (which I've
: been led to believe should be one of the easiest parts to convert), so I
: now have just a couple of other questions...

: 1) Are there game-type libraries around for various C-compilers to handle
: sprites, hardware scrolling, sounds and the like. If so, then will my
: choice of C compiler affect which libraries will work?

Warwick Allison's C++ game programming library for GNU C++ seems quite
nice. You'll need _at least_ 4Mb to run GNU C++ and Warwick's library
is a bit old (no support for newer machines like Falcon).

:2) Not really another question I guess...Which C compiler (English language)?

Only free alternatives are SozobonX C
(ftp.fu-berlin.de (somehere like /pub/atari/programming/sozobonX))
and GNU C. With GNU C you need _at least_ 2MB of ram. Both of the
compilers are a bit 'unixy' to use.

>
> There's been a change of plan!
> Does anyone know how to do this using 68000 assembler?
> Thanks again.
>
Use BIOS calls :

Bios #1 int Bconstat (int dev);
Bios #2 int Bconin (int dev);
Bios #3 int Bconout (int dev, int databyte);

Use dev = 3 for accessing the MIDI port. Bconstat returns -1 ($FFFF) if
data is present, 0 otherwise. Calls in assembly language shown for
Bconout :

move.w databyte, -(sp) ; Provide data for output
move.w #3, -(sp) ; Provide port number for MIDI
move.w #3, -(sp) ; Call function number 3 (Bconstat)
trap #13 ; Do the BIOS call
addq.l #6, sp ; Clear the stack

The other two calls look the same, just replace the function number; you
find the return value in the lower 16 bit of D0 :

move.w #3, -(sp) ; Provide port number for MIDI
move.w #2, -(sp) ; Call function number 2 (Bconin)
trap #13 ; Do the BIOS call
addq.l #4, sp ; Clear the stack

Replace the number '2' in the second line by '1' in order to call
Bconstat.

Cheers Peter

2132. Iconifying windows

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-06 00:00:00 UTC
From: Chris Ridd <C.Ridd@imc.exec.nhs.uk>
Message-ID: <31172367.82@imc.exec.nhs.uk>
Source record: 10171

I'm trying to implement a menu option that iconifies the current window in an app.

This doesn't work too well because to do the wind_set(WF_ICONIFY) I need to pass it the iconified window's x/y/w/h (*not* the original window's x/y/w/h), and I don't know any of the values!

The usual iconification procedure just reacts to the GEM WM_ICONIFY message, which passes these coords to the app which simply does a wind_set(m[3], WF_ICONIFY, m[4], m[5], m[6], m[7]).

How do I find out the values to pass to wind_set?

I'm using AES 4.1...

Why don't you just slightly modify TOSWIN? If I've understood correctly,
XaAES has features that make it possible for TOSWIN to run without
being in busyloop and hence wasting CPU power for nothing.
I thought I would do this modification when XaAES would be available,
but of course it'd be great if someone else did it for me :-).

Very well observed! And solution is... none. Iconify was designed
to work only when the user clicks on the iconifier in a window name
bar. The best you can do is do your own alignment of icons along
some other side of the screen...

Anyway, don't bother writing for MultiTOS because nobody really
uses it...

Does anybody know how notmem() should function. Mine appears broken in
that it bombs when given an odd address, so do I write a new notmem()
or come up with say Notmem() which calls notmem() after it's checked
the address is even.

I know this is of little relevence as allocation has to return even
aligned blocks but what about on a system where this is not the case?

I'm just curious :-)

From: mickey <mickey@two-dogs.demon.co.uk>
Message-ID: <3119A897.92D@two-dogs.demon.co.uk>
Source record: 10178

Hi there,
I'm trying to write a tsr program. What it needs to do is check for an input at the extra joystick port (STe), when it sees one it inserts a character into the keyboard buffer.

The idea is to make a remote control for Cubase. Using switches (instead of a joystick) to activate the transport controls in cubase.

I was thinking of using a desk accessory to install the tsr and then let the key assignments to be changed on the fly.

Problem is where do I start? Does the joystick generate an interupt? I don't want to uses a timer to call the tsr as this may upset Cubase's timing. I'm using Prospero C (freebie with ST mag) but no manuals :(

Any Help would be much appreciated, Mikey.

p.s. Please could you reply my email as i don't get on usenet very often.

He was looking for the opposite, converting a long integer to a string.
ISO/ANSI/POSIX do not fully offer that functionality. Sprintf() only
handles octal, decimal and hexadecimal representation.

2149. Lattice vs Pure C

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-08 00:00:00 UTC
From: sanders@sci.kun.nl
Message-ID: <4fchoo$54f@studs.sci.kun.nl>
Source record: 10188

Hi,

My basic question is: Do I want to get Lattice C? I already have Pure C 1.1, but I find out that support for the latest TOSes (I have a Falcon) is not complete. I could of course hack my own function calls for stuff like VsetScreen() (and have done so) but this is not my favourite solution.

I spent the best part of yesterday trying to convert the XaAES logo program source form Lattice to Pure C. I had to make an rc_intersect() (luckily I could cut that from the EnhancedGEM sources). I finally got it to work, but the logo is distorted and I get two bombs on exit. And this program is _really_ small...

So how does Lattice C (which is the only currently supported C, right?) compare to Pure C? Pure _used_ to produce faster, shorter code. But even stuff I program myself seems to be rather buggy under MiNT/MultiTOS. (Well, that could be my fault, of course...)

What I like about Pure C is its development environment (nice integrated help and stuff), its compiler speed, its code tightness and speed, and the integrated assembler. How does Lattice compare on these points? (_Is_ there an assembler or would I have to get Devpac?)

Lastly, is there some sort of upgrade path (HiSoft taking my Pure C originals and give some money for it :-) ?

Regards,

Hi folks,

I just started with game programming on the falcon.
I want to write a 3D-game and am using C, eventually
with some assembler.
My biggest problem: I come from the PC and Mac-world and
therefore I have serious problem to figure out how to get
the best out of my Falcon.
One example: I made a little program with two swap-screens
to figure out how fast the falcon is in 15 bit mode.
I noticed that the framerate dropped dramatically when I
moved the mouse during the animation.
I assume that it has something to do with some kind of system
interrupts, but I have no idea.
I'd really appreciate if someone has some basic C-routine, like
"hello world", just for games, which includes all the typical,
needed initializations to get a game going on the falcon.
Any help would be appreciated.

2152. file format of Sound Designer I and Avalon

Hi everybody,

does anybody know where I could get the specifications of the sample format
of the sample editors Sound Designer (Digidesign) and Avalon (Steinberg)?
Both programs are rather out of date and ran on the Atari St platform.

Any information would be highly appreciated!

An easy and cheap solution is to use the free MiNTlibs (and gemlibs?)
which work on Pure C as well as gcc and Lattice. The MiNTlibs certainly
support more recent GEMDOS calls..

> So how does Lattice C (which is the only currently supported C,
> right?) compare to Pure C?

Lattice is not being developed any more. It is still supported in a
sense, however Hisoft are not keen to release any more versions.

> (_Is_ there an assembler or would I have to get
> Devpac?)

Yes there is an assembler. It works but isn't as good as (say) Devpac.

Many moons ago, I wanted to do the same thing but couldn't locate any info. What I ended up doing was creating a sample in Avalon that was 100 samples long - 16bit. Then, in the sample info page I filled in all the data I could, loop points, comments, etc, making them all different. Then I did a hex dump of it and worked out what every character meant!! It took ages, but then I still havent received any replies to my original enquiries, and that was about 4 years ago.

I don't have this info any more, but hope the suggestion helps!

John.

2156. 68000 disassembler source code needed

> So how does Lattice C (which is the only currently supported C,
>right?) compare to Pure C? Pure _used_ to produce faster, shorter
>code. But even stuff I program myself seems to be rather buggy under

PureC should only produce faster executables for very simple code
(or code with lots of function calls). It's optimizer is almost
non-existent, but it does really good register allocation.

Lattice C has a very good optimizer, but its register allocation often
lets it down. Especially it seems to have problems optimizing when you
use 16 bit ints. I've had code run twice as fast when compiled with
32 bit ints, for no reason other than that the optimizer got confused
by the 16 bit ints.

GCC beats both the others when it comes to optimization, but its
inability to handle register parameters to functions can cause
performance drops sometimes.

I did a comparative test between GCC, Lattice C and TurboC some years
back, compiling MGIF with full optimizations on all of them (that was
the beginning of my involvment with MGIF, by the way).

While the TurboC code was slightly faster at a few things, it also lost
by as much as six (6) times at other code because of the lack of
optimization.
I've not seen any real difference between the code produced by PureC
and the TurboC version that was used for the test back then.

I could probably dig up that old article if anyone's interested.

> What I like about Pure C is its development environment (nice
>integrated help and stuff), its compiler speed, its code tightness and
>speed, and the integrated assembler. How does Lattice compare on
>these points? (_Is_ there an assembler or would I have to get

The lack of a source level debugger was always the main problem with
Lattice C IMO, but there is supposed to be a third party one available
by ftp nowadays. On line documentation can be had via ST-Guide and the
environment for the later Lattice versions was much better than the
PureC/TurboC ones IMO.

Naturally, compile speed is important as well and there's nothing that
comes close to PureC for that.

I myself use GCC at least 99% of the time nowadays.
It looks like it's the only one of the three that's still supported.

Hi Peeps
Looking for a sub routine that will take the current date, ie DDMMYYYY
and return the actual day ie: Mon, Tues, Wen etc etc
Something as small as possible that will also take into consideration
leap years and will work from any year to any year

Put simply, I need to know the actual day name, of any given date,

Please help if possible, Many thanks :)

BTW, Any Basic Launguage will do as I should be able to convert it<?>

Cheers......!ynoT

2159. DSP - matrix setup & LOD files

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-10 00:00:00 UTC
From: ee11aw@surrey.ac.uk
Message-ID: <4fif2a$al2@info-server.surrey.ac.uk>
Source record: 9998

Hi,

I'm trying to write a program which uses the DSP - however I'm having problems setting the matrix & loadinig DSP files. What I need to know is:

1. How can I configure the matrix to do the folowing;

a. ADC -> DSP -> DAC (i.e. Add a DSP effect to sound going from the mic input to the headphone output)
b. DMAplay -> DSP -> DACa (i.e. Add a DSP effect to a sample file being played back)
c. ADC -> DSP -> DMArecord (i.e. Add a DSP effect whilst recording a sound file)

(I know I'm supposed to use the Devconnect() command, but every combination I try doesn't seem to work.)

2. How do I load .LOD files? I have the 'Modern Atari System Software' (?) book that lists all the commands but it just confuses me - which functions should be used, and how do I know how much memory should be allocated for the .LOD file. (The .LOD file's I'll be using are those that come with WinRec - I might right my own later, but I want to test the DSP set up now.) The book gives some wierd formula for working this out - but as I don;t know much about the X,Y, and P registers of the DSP it doen't make any sense to me.

Thanks for any assistance.

Please email any replies to: ee11aw@surrey.ac.uk
(This is because I can only check the newsgroups about every month or so)

Yes, there's Lattice stci_d family which only do dec, oct and hex.
I wrote one for binary. Low base numbering systems aren't that difficult.

2162. Speedo Fonts in G_PROGDEF

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-11 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4fkanu$9i6@inca01.inca.co.nz>
Source record: 10001

I have just been playing with G_PROGDEF objects in my dialog boxes.

having written check-boxes and radio-buttons that mimic the behaviour on Widows and Mac, using G_PROGDEFs,

All this was done using Speedo 4.1 under GEM AES 4.1, with MiNT 1.12, with memory protection 'on'. I run a 20 Mbyte TT with TOS 3.05, and usually have between 8 and 12 Mbytes of RAM left when running the generated code.

I thought it would be straighforward to implement a font sample inside a dialog box using G_PROGDEF, and drawing the text within it using v_ftext.

But, to my horror, I find that it seems to bring the system to a "you must reboot" stage any time I use any Speedo calls within the G_PROGDEF code. Standard VDI calls work OK.

My general algorithm in Lattice C 5.60 is as follows:
(I've snipped out obvious clipping/positioning code)

There are no AES calls within the PROGDEF code.

```
int __stdargs __saveds progdef_callback( PARMBLK *pbptr )
{
sint16 fnum;
sint16 fsm;
schar8 name[32+1];
sint16 d;

fnum = vqt_f_name( vhandle, font_in_list, name, &fsm );
vst_font( vhandle, fnum );
vst_arbpt32( vhandle, 0x98000, &d, &d, &d, &d ); // 9.5 point text

//positioning... set x, y

v_ftext( vhandle, x, y, name );

return 0;
}
```

So, is it a bug in Speedo, GEM, or my code?

2163. v_justified characters missing

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-11 00:00:00 UTC
From: Andrew Owen <andrew.owen@gecm.com>
Message-ID: <4fkoei$4rt@gcsin3.geccs.gecm.com>
Source record: 10002

having just got interested in actually programming on the atari I've tried
to write a small program, the problem is that using v_justified misses the
first two characters of the string. Most of the program was copied from
COMPUTE! VDI book.
Any help would be greatly apprieciated.

The following program prints

TEST ITEM G1
S T I T E M V 1

TEST ITEM G2
S T I T E M V 2

etc
I've programmed in 'C' for a while, but this is my first attempt at GEM/VDI
, I'm using a 1040STFM TOS 1.4 4MB with Lattice C 5.5. It even gives me the
problem when run with no AUTO or ACC's.

Andy.

```
-----------------------------------------------
#define TRUE 1
#define FALSE 0
#define NORMAL 0x0000

#include <osbind.h>
#include <vdi.h>

/* Global variables - For VDI bindings, etc */

short contrl[12], intin[128], ptsin[128], intout[128], ptsout[128];

short handle;

short work_in[12], work_out[57];

/* Initialisation starts here */

void main( void)
{
short x, nul, button, charh, charw, cellh, cellw;

button = 0;

/* Initialise the GEM application */

appl_init();
```

```
/* Initialise input array, get the physical workstation handle,
and open the Virtual Screen Workstation */

work_in[0] = Getrez()+2;

for( x=1, work_in[10]=2; x<10; work_in[x++]=1);

handle = graf_handle( &charh, &charw, &cellh, &cellw);
v_opnvwk( work_in, &handle, work_out);

v_hide_c( handle);
v_clrwk( handle);

/* perform the graphics demos */

v_gtext( handle, 20,cellh,"TEST ITEM G1");
v_justified( handle, 20, cellh*2, "TEST ITEM V1",

I found with a simple program to find primes up to 60000 that Lattice C
(31 secs) beat GCC (49 secs) hands down, (Both optimised with 16 bit ints).
While the same code run under MagicMac on my 25Mhz 680LC40 LC475 using
Lattice C and Mac using Think C took an identical amount of time (3 secs),
but under Spectre on the 8Mhz 68000 ST the Think code was the slowest (58
secs) (this is just the calculation with no screen work).

I use X-Debug on the ST for source code debugging the lack of structure
support is a pain but it better than assembler level debugging.

Of course GCC is more than just a C compiler as it does C++ as well which
is nice. I redirect the stderr error messages to a file to make it easy to
find source code problems.

2170. vqt_get_table()

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-11 00:00:00 UTC
From: Andriopoulos Panagiotis <paa@prometheus>
Message-ID: <Pine.SOL.3.91.960211210929.21696A-100000@prometheus>
Source record: 10009

Some people asked me to post details about the vqt_get_table() function. First I want to make clear that I dont have any official docs for this nice function. I found its usage by disassembling SpeedoGDOS. It worked on my machine, it will probably work on your machine but if it doesn't please dont blame me :-)

First add the following text to your "vdi.h"

```
/* begin */

typedef struct speedomaps {
struct speedomaps *next;
unsigned int id;
int *table;
int dummy;
}SPEEDOMAPS;

void vqt_get_table(int handle, SPEEDOMAPS **map);

/* end */
```

map will be filled with a pointer to a SPEEDOMAPS structure

As you can see the SPEEDOMAPS structure contains:

a pointer to the next SPEEDOMAPS structure if one exists,

an integer value which distinguishes the various mappings, possible values are:
For Speedo fonts : 0x3030, 0x3031, 0x3032, 0x3131, 0x3132, 0x3133, 0x3134
For Postscript Type 1 : 0x5431
For TrueType : 0x5454

a pointer to an array of 224 integers which is used as a lookup table for ASCII 32 to ASCII 255 and

an integer which I dont know its purpose, if it has any.

So if somebody wants to change the mappings, calls vqt_get_table() to get the pointer, then walks through the list until he matches the id he is searching (you shouldn't expect that all of the above id's exist under all versions of SpeedoGDOS). Now you either change the pointer to your table or you change the internal table values. I dont know which method is legal but which ever you take keep in mind that there is no function to restore the default values. It's up to you to take a copy of the default data.

Another method to change the mappings is by creating a file called SPDCHAR.MAP . Its structure is very simple. For each mapping you want to change you put its id followed by 224 words. Simple. Note that you dont have create tables for all possible ids and also there isn't any order you have to follow if SPDCHAR.MAP contains mappings for more than 1 id. The new mappings are set during the boot.

I had a very good motive to find out how to change the mappings. I'm Greek and when SpeedoGDOS 5 was released I hoped that at last I could use some decent Greek TrueType fonts. Imagine how I felt when I realised that most Greek characters where vanished! I hope other "minorities" of the Atari world will find this text helpfull. The bad news are that NVDI 3.01 (dont know for newer versions) does not support the vqt_get_table(). Its a shame because it spoils an otherwise perfect piece of code

I wrote a patch which changes the way NVDI builds the lookup tables in NVDI.FIF but its not the same :-(

Thats all folks

Panayiotis

>
Any data packet from the keyboard processor (joystick data also arrives
that way) causes an MFP interupt. Dunno the number from memory. But you
don't need to change this vector, as the kernel interupt processes the
data via a list of vectors, each specifically for a particular event,
like key presses, mouse data, or joystick data, so you just have to
replace the joystick vector. The address of that list is returned by
Kbdvbase(), an xbios call.
After you installed your routine you must also tell the keyboard
processor to look for joystick movements and to report them.

Cheers Peter

I nearly just answered without compiling it first - good job really.

I was going to say that v_justfied() needs GDOS and leave it at that
but it worked fine on my 520STFM TOS 1.4 4Mb with and without NVDI and
with and without MagiC using Mark Williams C 3.0.9.

This begs the question - is Lattice at fault? Over to somebody else!

2174. Cheap Jaguar Dev. Kit.

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-11 00:00:00 UTC
From: roine@stacken.ct.se
Message-ID: <ftn_2.204.219_11e68bc0_Roine@stacken.ct.se>
Source record: 10013

```
------------------------------------------------- 951231
Info about the Jaguar Server.
-------------------------------------------------
Current hardware revision B.
BootROM B001, JagOS version 1.07

A | in front of a line means that some new stuff
has been typed in there since the last info file...
-------------------------------------------------

The Jaguar Server project started out in August '94. The goal
was to make a cheap developer kit for anyone that wanted to
program for the Jaguar. Atari's own developer kit was $5500 and
that was WAY to much if you just wanted to hack and program the
Jaguar just for the fun of it.

The very first prototype was built around the Mega ST's 'MegaBus'
All of it was hand wired together using a total of 21 IC's.
I can tell you that this board had VERY little empty space on it..
This prototype was soon scraped, as i begun work on the Rev A
board, using a different approach this time. It was built for the
cartridge port and could then be used on all Atari computers not
just the ones having a 'MegaBus'.
To keep the cost down, i also decided to use the Jaguar's 2MB
main memory and not include any expensive RAM chips in the Jaguar
Server hardware.

The Rev A board was up and running with very simple software in
Februari '95. As the Rev A board had some small flaws, i made
some changes to the layout and came up with the Rev B board.

More serious work now begun on the Software - The Shell running
on the Atari computer and the JagOS - Running on the Jaguar.

-------------------------------------------------
General Info.
-------------------------------------------------

* Use the Jaguar Server kit to develop Jaguar programs !

* The Jaguar Server runs on all Atari ST/STE/Falcon/TT computers.

* The hardware plugs into your computers cartridge port. From the
cartridge hardware goes a 40 pin ribbon cable into the Jaguar.

* Uses a slightly modified standard Jaguar. You send our Jaguar
to me for modification, and i'll send it back to you.
```

* You can change betweeen 'modified' and 'orginal' Jaguar by the
flick of a switch. A reset button is also installed.
ABSOLUTELY _NO_ compability problems with Jaguar games.

* No programing restrictions apart from a 2Mb main memory limit
in the Jaguar. Future software updates will be able to upload
data at the command of a running Jaguar program.

* You use the Jaguar Server software to upload programs/data to
the Jaguar. The software looks best in resolutions over 640*400.

* Software updates to JagOS (Jaguar Operating System) are possible
without burning a new EPROM chip simply by using newer software.

| * Upload transfer rate is currently 83 Kbyte per second on a 8 Mhz
| Atari and 131 Kbyte per second running at 16 Mhz.

* Use the Devpac 3 assembler or any other code generator to write
programs.

* A remote debugger is under development.

* Software updates and info are availible on InterNet World Wide Web
at http://www-und.ida.liu.se/~t94patsa/jserver.html
and by filerequest with any FidoNet compatible mailer to
STacken BBS on FidoNet 2:204/219 under the magic name JSERVER

* A Jaguar Server Developer Mailing list are availible for
programming discussions. NOT open for anyone.
E-mail to nat@zumdick.rhein-main.de for more info

* The Jaguar Server development kit contains this...

+ Jaguar Server cartridge (hardware)
+ Jaguar Server Shell & JagOS (software)
+ Switches, ribbon cable, connectors and everything else
that you need to start programming right away.
+ A few Jaguar (*.JAG) programs and example source code.

* IT DOES _NOT_ CONTAIN THE FOLLOWING... You have to get these
things yourself....

- No 68000 or Atari RISC assemblers.
- No Jaguar technical documentation.

* 'Hacker' experience and good knowledge of assembler programming
is STRONGLY recommended because of lacking Jaguar technical
documentation.

* The Jaguar Server is NOT connected to Atari Corp. in ANY way.

* _Introduction_ price is :

3400 Skr
| 730 DM
| 330 GBP

```
| 510 USD for the Jaguar Server and a new Jaguar console
(Swedish PAL without game!), modified and ready
to be used directly.

1500 Skr
| 325 DM
| 145 GBP
| 225 USD for the Jaguar Server and modification.
You send your Jaguar to us...

Shipping is NOT included in these prices and will be added!
Around 200 Skr for shipping is normal.

------------------------------------------------
Some technical info.
------------------------------------------------
A Jaguar (*.JAG) program is built around a header. There are
currently five different headers, each with it's own use
and advantages depending on the development environment and
programs.
For example, one of the headers looks like this (for Devpac 3)

*---------------------------------------------------------------*
* Standard JagOS 3 Upload & Run parameters. *
* ? Roine 950420 *
*---------------------------------------------------------------*
OUTPUT i:\*.JAG * Output standard Atari Executable.

down EQU $5000 * Download adress in Jaguar.
start EQU $5000 * Program start adress in Jaguar.
OPT D- * No debugging info.

dc.b 'JAGR' * Magic to skip Devpac Header.
dc.w 3 * JagOS 3 - Recive & Run.
dc.l down * Download adress.
dc.l c_end-c_start * Lenght of Jaguar Code.
* A dc.l 0 are also possible.
dc.l start * Start adress.
ORG start * If position dependent code.

*---------------------------------------------------------------
c_start * Jaguar code start.....
NOP
NOP
ILLEGAL * Not much of a program... Hmm...
c_end * Jaguar code end.
*---------------------------------------------------------------
END

------------------------------------------------
Jaguar Modification
------------------------------------------------
As there has been some trouble with users installing things wrong when
```

modifying their Jaguars to accept the Jaguar Server Development kit,
I have decided to NOT to let users do this modification on their own
any more.

I really think that this solution is the best for both parts.
This means that the Jaguar Server Development kit will work when you
get it, just plug it in the computer and start programming and i will
get happy customers with working kits!

This means that you now _MUST_ send us your Jaguar console and i will
do this modification for you. This will ensure that the modification
is correctly done and working 100%
It is also possible to order a complete new Jaguar Console (PAL) if
you for some reason cant send your Jaguar to us.

Misc Info.

If you have more specific questions or want to order,
write me by E-Mail...

Roine@stacken.ct.se

2175. GFA Basic 3.5 FPU support?

Newsgroup: comp.sys.atari.programmer

I am trying to install the Sys Gem 2 library on my Pure C system.
However, the Pure Linker gives me the "undefined symbol" message
whenever I try to build a program.

I have installed the LIB file and the H file in the correct
directories, and the PRJ file contains all the LIBs delivered
with Pure C plus SYS_GEM2.LIB.

I get 8-10 undefined symbols, and I remember two of them to be:

"vdi"
"appl_search"

I have of course tried to build the demo program, and the same
things happen. I am sure I have just forgotten something really
stupid, but please help!

From: Insh_Allah <i_a@mbh.org>
Message-ID: <311FAF9B.2781@mbh.org>
Source record: 10018

Hi folks,

I'm looking for tools (_anywhere_ on the Internet) which will allow me to create ST Guide On-Line Help documentation files from some (yet undecided) input format, preferably Texinfo or RTF (Rich Text format).

Any idea where to get this kind of goods and what I should look for exactly? If you now source-level distributions (preferably UNIX compilable!) I'd be jumping for joy :-) as I'd like to cross-compile these ST Guide On-Line help dox when possible on SGI or Sun UNIX.

It's absolutely fine though if you've got a pointerto an ST based tool as I'll have my friends do the job for me then ;-)

I'll check this newsgroup but if you can: please CC your answer to my email address below:

Ger(rit) E.G. "Insh_Allah" Hobbelt
Email: i_a@mbh.org

Thanks!

This is only true for the 'Standard Joystick Ports' and IIRC he was
asking about the extended joystick ports of the STE.

The extended joystick ports are directly memory mapped (hurray!) and
don't go through the keyboard processor, which unfortunately means that
they do not trigger an interrupt (boo!).

So you'll need a TSR that patches onto a timer interrupt and polls the
hardware addresses of the extended joystick ports. I should use the
Vblank interrupt for the timer, as joysticks don't need much polling.

Try setting the compiler switch for `generate underbars'. It could be
that you have it set off, and the libs were built with it on. So the
linker tries to find `vdi' which is called `_vdi' in the libs.

Good luck,

2182. converting ATARI ST software to IBM 486DX33

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-12 00:00:00 UTC
From: schmoo@pathcom.com
Message-ID: <4foefk$r44@pathway1.pathcom.com>
Source record: 10021

Hello!

I am the owner of both an Atari ST and an IBM-compatible, a 486DX33.

My question is this. Now that I'm using the IBM for a lot of my work at business, I'm kind of missing a lot of the games that I used to play. The Atari is getting kind of glitchy I've noticed, and I'm really annoyed that many games that I paid good money for are going to go to waste.

Is there any way to run this software (short of re-buying the IBM versions) on an IBM that anyone knows of? I am feeling kind of doubtful that I could actually run anything right off of the diskettes, but I would easily be willing to settle for an emulator which I could use to translate Atari ST software over a modem connection or direct port connection.

Any ideas or suggestions? If so, please e-mail me directly at my address below.

Thanks,

Derek.

schoen@dial.eunet.ch wrote:

: My biggest problem: I come from the PC and Mac-world and
: therefore I have serious problem to figure out how to get
: the best out of my Falcon.
: One example: I made a little program with two swap-screens
: to figure out how fast the falcon is in 15 bit mode.
: I noticed that the framerate dropped dramatically when I
: moved the mouse during the animation.

Just a hard fact : there isn't anything you can do to speed up things
apart from using assembler. Falcon is simply terribly slow machine
especially in high color mode....And for all the Atari advocates, I have
coded on both Atari and Amiga machines so I know... Falcon has a
16-bit bus to the memory so the direct movem.l d0-d7/a0-a7 thingy is only
able to pull about 64 kb/vbl which is simply bad performance. With some
trics you can get something like 100 kb/vbl but even that ain't enough.
My advice to you is that if want to code games (with fast graphics) you
better use only the 256 color mode. Or start coding games on diffrent
machines. If compare Falcons speed to the other machines it easy to
notice slow it actually is.
For example :

Amiga 1200 7 mb/sec (12 mb/sec)
486 PC with vlb/pci bus 22-50 mb/sec (depends on card)
Pentium PC with pci bus and fast card 50-80 mb/sec
All Powerpc machines with pci bus 30-80 mb/sec (depends on card)
Falcon 030 3.2-5 mb/sec

All figures are for the writes to video memory. In amiga's case the
second figure is for the fast memory(fast mem can only be used for the
normal data, not for the graphics). On Falcon all the operations are in
3.2-5 mb/sec range.

>in C?

Your code needs to be __saveds and depending which interrupt you may want to
make it __asm so you can get the values passed to you. Apart from that, just
write the address of your routine into the vector. To go tsr, you quit with
Ptermres().

>When linking into the interrupts, is it possible to make the program both
>screen resolution and machine independant, ie. it will run on both an ST and
>a TT withoout to much effort in coding seperate sections for either machine.

That depends what interrupt. It shouldn't be a problem with msot things.
Obviously if you need to do some graphics it's not really possible as I
don't think GEM is re-entrant.

Not as far as I know, I've never heard of it being sold in England at all.
It is sold in the US but I seem to remember it still had German docs.

Well of course you do. C++ files are almost always .cc, .cpp files are
ones that although not C or C++ need to be run through the C preprocessor.

> now managed to get it working but it is SLOOOOWWW. On my falcon with 4

It is rather a memory hog, you might find an earlier version better.
Compiling STonX on my linux PC took half an hour on one file because
it needed 40 megs!

Loading a resource file yourself is pretty easy, but I wouldn't have though
rsrc_gaddr would work in that case (unless it has some undocumented option)

I believe Cfront, the original C++ implementation, used .C, but for obvious reasons this can't be used in a DOS environment (and may cause confusion even under a real operating system) Later unix compilers used .cc but for some reason both MS and Borland chose .cpp for their PC versions.

It isn't. The BIOS is re-rentrant 3 times (?). I have used the LineA
in non complex interrupts but I don't know if it is documented to be
so.

It does work, if the address for the RSC file is set in the global array...

I don't know of any, but there is some hope in that the author of UDO is 'looking' at adding some reverse conversion modules (UDO converts UDO files into several formats including STG HYPs) and RTF to UDO is one of them.

would have been suprised if you hadent? ;)

>Tony, what about that _ugly_ mouse pointer? You can't miss that!

Ho dear, your one of THEM! are you,???? your one of those
people who had a look at STOS years ago,looked at the sad stuff
every man and his dog was knocking out at the time, and
have stuck with that view ever since?

Well my language disk has a true GEM mouse set and GEM
fonts installed, these are part of the interpreter, ie the
default mouse and font sets, YOU are well behind the times
mate, I have over 50 titles released, you try finding the
old STOS mouse pointer on any released over the last three
years?

Unfortunatly you are not alone, many people are still
basing there opinions on the STOS of old and not the 1996
updated version, I would advise yourself and anyone else to
read ATARI WORLD issue 12, you will then learn just how
updated STOS is,?

I don't know how helpful this would be, but a book on the 68000 by Lance Leventhal (from around 1980, I think) contains a table with the instruction set and all the machine language equivalents. I could probably find it at the library and get you a photocopy of those few pages...

(When I say machine language equivalents, I mean the patterns of bits that correspond to each mnemonic... It's tedious to look over, but it should point you in the right direction, depending on what you intend to do.)

Heh. Heh. And double heh.

Dennis, Britain & the American Colonies only adopted the Gregorian Calendar
in 1752. So any date prior to that was on the Julian Calendar. Most of the
Catholic nations of Europe adopted the Gregorian calendar imediately, but
not us stubborn Brits. How come we're always at the tail end of everything?

And Dennis, up here in Scotland we still have pound notes printed by 3
banks. What's more, they are still legal tender.

I think that makes it 2-0? =:o]

Why do you think most games at the moment do use the high colour mode?

It's faster. To set a pixel in high colour mode you write two bytes, to
set it in 256 colour mode you need to do eight separate bit operations.
Had Atari made a chunky 256 colour mode it would have made much better
speed possible, but as it is high colour is fastest for most things.

Out of the ether, the following was mentioned by mnb20@cam.ac.uk...:

m> Your code needs to be __saveds and depending which interrupt you may
m> want to make it __asm so you can get the values passed to you. Apart
m> from that, just write the address of your routine into the vector. To
m> go tsr, you quit with Ptermres().
Ok, any sample code???
;-)

m> That depends what interrupt. It shouldn't be a problem with msot
m> things. Obviously if you need to do some graphics it's not really
m> possible as I don't think GEM is re-entrant.
Well looking at the interrupts and other comments I was led to believe that
the best int to use was the VBL which is screen mode specific.

I would like to write an interrupt driven routine which can be a TSR and sit
there polling the comm port waiting for a certain string then do its stuff
once it has been resolved so no graphics involved.

you.

>Well looking at the interrupts and other comments I was led to believe that
>the best int to use was the VBL which is screen mode specific.

It's only the best interrupt if you really want to do something regularly.
An interrupt triggered by a particular event would be better.

(of course, the only thing that's screen mode specifc about the VBL is its
frequency, which for what you want to use it for is irrelevant anyway)

>I would like to write an interrupt driven routine which can be a TSR and sit
>there polling the comm port waiting for a certain string then do its stuff
>once it has been resolved so no graphics involved.

I can't remember how to do it now (I don't have any docs with me either) but
it should be possible to hook the rs232 receive vector, so you could do the
processing there, wouldn't that be easier?

2222. '030 MMU and bus error stack questions

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-18 00:00:00 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <4g74hf$qd@nyheter.chalmers.se>
Source record: 9911

I've finally got around to porting my Sinclair QL emulator to the Falcon030.
Unfortunately, there are some problems which I can't do much about with
the documentation I have.
I would prefer not to have to buy Motorola's reference manuals only to
look at a dozen pages or so.
A pointer to some in depth '030 documentation on the net would be much
appreciated.

Now for the problems:

First, the Falcon normally sets up an MMU table between $700 and $800
(at least with my TOS 4.01).
The problem is that the Sinclair QL expects its ROM with the OS to be
positioned at the bottom of memory, so the table must be moved.
But what is the information in that table? And how should the
initialization of the MMU registers be changed?
I know that it would be possible to remap the address space so that the
emulator could run in its own, protected, memory space. To make that work
I'd still need the same information, though.

Second, the QL emulator currently relies on a bus error handler to do a
kind of instruction modify and restart for some of the QDOS calls.
Now, on the '030 the bus error stack has a lot of extra information to
enable the continuation of instructions.
What is that information?

It could be possible to set up appropriate arrays of OBJECT pointers and
TEDINFOs and so forth, and then embed that into the AES global array.

Yes,of course if you kill the mouse things will speed up...But this
isn't the case, person who posted the original message is from pc/mac
platform and it can be kinda hard to start coding games on 16 mhz
machine,especially if you want them to be any good.

: : Just a hard fact : there isn't anything you can do to speed up things
: : apart from using assembler. Falcon is simply terribly slow machine
: : especially in high color mode....And for all the Atari advocates, I have
: Why not use the DSP, after all, what is it there for? Decoration?

Yes, dsp can be used it's just that it won't help you _draw_ polys any
faster...You can calculate things very fast with dsp (something like 1
cycle for mul) but the overall performance will be rather bad because of
the slow video. It's easy to see the effect of the bad video, just plug
slow isa video card on the pentium machine and watch how the things
crawl. Falcon could handle quite well games like wolfenstein 3d and doom
where with carefull optimisation all pixels could only be drawn once.
But the original poster stated that he wanted to write 3d games with
Falcon, and atleast I understand that this means games with polygons.

It doesn't take much of the programmers skills to understand that if you
have to draw polygons with one pixel at the time, on 16 mhz machine with
16-bit bus to the memory the performance can't be that good.

Thanks, but it's not quite what i'm looking for. You see i've written an
ST emulator in 80x86 for my pc and i've now got to the stage of
debugging it and running it through my ST's ROM (it's v1.0). I have been
able to check the opcodes it's processing by using the ST INTERNAL book
by abacus which has a listing of most of the BIOS of ROM. But my
emulator is crashing in the DOS part of ROM which is not in this book.
So what i need is a disassembler i can use on the ROM so i know what the
heck i should be getting....

(P.S. i am well aware that this is in no doubt the most useless method
of debugging a program!).

From: Christoph.Wawrosch@univie.ac.at
Message-ID: <4gaja6$him@ftp.univie.ac.at>
Source record: 9917

Hi all,

I have the following problem:
I want to convert sound files, namely from Windows *.wav to Steinbergs Avalon
*.smp format. I have no problems with all the headers and tails and stuff,
but I couldnt figure out how to convert the data itself.
In the *.wav file each sample word is stored as a signed integer with the LSB
first, i.e
-34268 = &H8000 = 00 80 in the file
+34267 = &H7FFF = FF 7F in the file, and so on.
In the target *.smp I find a unsigned integer with the MSB first:
255 = &H00FF = 00 FF
40215= &H9D17 = 9D 17 etc.

Any hints (GFA-Basic 3.5) would be highly appreciated!!!

Hello

Is the QL emulator you have ported to the Falcon a software emulator.

As I thought all the Atari emulators were hardware emulation. The best been the QVME card which slots into the VME bus on the TT and Mega STE. I suppose if the Falcon had a VME interface then this could possible.

During the development of a game I'm writing, I seemed to have come
across a strange problem.

I developed a small subroutine in my game whose sole purpose was to set
up and load relevant MOD files to play in-game and at various other
stages (title screen, high score, etc.). I simply passed the name of the
MOD and its size and the routine loaded it into an array. However each
time it did this, it would first eraase the array, and then redimension
it for the required size of the MOD. Now this all seemed to go all very
fine and well. During testing I played the first ten stages of the game,
after which several routines were designed to change the screen backdrop,
tile set (it's a logic/puzzle game) and the in-game music. After level
10, stage two begins with a new backdrop, new music, new tiles, etc, and
everything seems to go fine -- until i click on a tile, at which point
the MOD music just completely screws up.
Now, I solved the problem simply by defining a global constant array
for the size of the largest MOD in the list -- a last ditch attempt that
I didn't think would work -- having decided that redimensioning the array
was pointless anyway. To my surprise, it worked! The music no longer
screwed up when a new MOD was loaded and a tile clicked on.
But my curiosity's got the better of me. Why did the music screw up in
the first place? Is there a bug in the erase() command?

: 640x480x16 I can set the video to the same mode, however from
: any other mode it trahes the screen. What am I doing wrong? I
: am using assembler.
Do you allocate enough video ram?
640x480x256 needs twice the video ram needed for 640x480x16. You can get the
size of a scrren mode with the VgetSize(mode) function, set the new video
ram with Setscreen and then use Vsetmode.
Also another way is Setscreen()L, 0L, 3, mode)

ObAns:
Try VAL(A$). This works in every BASIC I know.

But:
You probably meant to convert binary numbers to normal base-10
integers, didn't you? Well, I don't know whether HBASIC supports
binary numbers, e.g. by means of some prefix. If it does, then you
could simply prepend that prefix to your string and VAL it then. If
not, you'll have to make up some kind of function for it.

Something like (off the top of my head, so no guarantees :-)

```
DEF FN bin2int (a$) ;or FUNCTION, or whatever HBASIC calls it...
res = 0
FOR i = 0 TO LEN(a$) - 1
res = res + VAL(MID$(a$, LEN(a$) - i, 1))*2**i
NEXT i
RETURN res
END FN ;of ENDFUNC, or whatever...
```

Something like that.

Regards,
--

That's of course possible using almost any programming language.

It isn't obvious that the number in A$ is in binary format, but if we
assume that, a simple pseudo code (Pascal-C-BASIC of sorts) program could be:

len = length of A$
num = 0
for i = 1 to len (assuming the string is indexed from 1 to len)
num = num * 2
if A$[i] == "1" then
num = num + 1
end if
end for

Hello I am using MagiCMac, I have a Quadra with a 25mhz 040 and 55mhz DSP, how come no one is upgrading to 040s they work GREAT with MagiCMac, you can get a 040 for under $100 (US). I am planning on writing some rendering software to use the 040 and maybe even my DSP. If wan't LOW 040 and even LOWER 030 prices take a gamder int he bac of a Mac Magazine you can find MANY great bargins.
Thanks for any ideas
Zan

2237. Setting Falcon Video modes?

u> 640x480x16 I can set the video to the same mode, however from
u> any other mode it trahes the screen. What am I doing wrong? I
u> am using assembler.

This is from a reply by Doug Little (he's one of the author of Apex)

Initialisation:

```
OldModeCode = VSetMode(-1)
OldPhys = PhysBase()
OldLog = LogBase()

VSetScreen(NewPhys,NewLog,-1)
VSetMode(NewModeCode)
```

Clean exit:

```
VSetScreen(OldPhys,OldLog,-1)
VSetMode(OldModeCode)
```

Avoid this at all costs:

```
VSetScreen(NewPhys,NewLog,NewModeCode)
```

Trying to use VSetScreen with both screen address pointers & resolution flags passed as valid parameters will end in chaos. You have to do both jobs separately.

Doug.

AIUI, if you have NVDI 3 running then you're in big trouble, it doesn't like rez changes much and you're going to have to save and restore the screen registers, and restoring the screen registers is apparently not easy - as *when* you restore them and what order you restore them can be crucial!

BTW after the first VSetScreen you can do another immediately after

```
VSetScreen(-1,-1,NewModeCode)
```

this helps too.

Maybe NVDI 4 is better!

Good luck :)

Phil

Well I finally got sozobonX to work. I was well happy when Dan is cool started scrolling down the screen (dan is cool is good for any test program message and is a throw back from my speccie days).
Any way.
I'm now looking for several things.
is there an editor which allows several files to be open at once and allows me to chain to the compiler?

Does anybody have or know where I can get documents/ files/ information on GEM programming.

If I wanted to make a file editor which could edit several files at once. How could I store the files in memory. i.e. how could I dynamically change the amount of memory for each file so they can grow in size. Would I give enough for say 10kb per file and then if I needed more I couldmove some of the files about in memory?

Does anybody know where I can get any extra libraries for sozobonX c
does anybody know of an interrupt driven sample player for c which will play a short sample in the background while allowing some processing to continue with my application. (I like funny noises and the like in any program, not just games.)

oh well I hope I've given you all something to think about.
DAN
AKA ROWLF

Yes, it's 100% software.

>As I thought all the Atari emulators were hardware emulation. The best

All the well known ones use hardware, but I didn't have the cash to pay
for one of them back in '89, so I wrote my own...

A handful of people used QLem back then, but until a couple of weeks
ago, I hadn't done anything with the program since '91.

Currently QLem only runs on 68000 based Ataris but, as I wrote, I'm
trying to do something about that.
QLem actually works to some degree under STonX (problems with the bus
error handling) and I'm planning on making it run without the ST ROM
and with its own screen emulation -> A QL on (almost) any UNIX system! :-)

Use realloc(). This makes the typically cryptic 'C' explanations of
realloc() a little clearer ...

```
tmp_ptr = realloc(cur_buf,cur_size + extra);
if (tmp_ptr == NULL) {
/* no more memory, cur_buf still valid */

if (cur_buf == NULL) /* can't get a buffer */
else /* can't extend/shrink buffer */
}
else {
/* cur_buf gone */
/* tmp_ptr contains a copy of cur_buf contents */
/* plus 'extra' space to use */

cur_buf = tmp_ptr;
cur_size += extra;
}
```

You misspelled "32768". :)

> In the target *.smp I find a unsigned integer with the MSB first:
> 255 = &H00FF = 00 FF
> 40215= &H9D17 = 9D 17 etc.
>

Unfortunately I know nothing of GFA Basic, so I'll have to write in C:

```
unsigned char a, c, c;
int i;

for (i=0;i<nbrSamples;++i)
{ a=getchar(); b=getchar(); putchar(b^0x80); putchar(a); }
```

Note that ^ is the C operator for "exclusive or".

Note that 0 for signed samples maps on to 32768 for unsigned:

```
00 80 FF FF 00 00 FF 7F -> 00 00 7F FF 80 00 FF FF
-32768 -1 0 +32767 0 32767 32768 65535
```

Good luck

Chris

BASIC TEASER
Open to coders of any BASIC Language

*** note that regular users of this echo actualy requested this
idea on irc channel #atari 22/02/96, I am simply supplying the
question so apologies to anyone who thinks this is wrong, but this
channel is desperate for traffic, enjoy ***

(1) You have a dimmed array, TEXT$(2000)

(2) You have loaded a document into this array, with each cell
holding a line of text,

(3) You display the text with something like
*****************************************

END=NUMBER OF TEXT LINES LOADED :rem this variables holds how
many lines of text there actualy are, could be 10, could be
1000
MARKER=0 : rem this variable holds position of text on screen,
ie 0=top of doc, END-21 = bottom of doc

REPEAT
I$=UPPER$(INKEY$)
IF I$="F" AND MARKER < END-21 THEN INC MARKER : GOSUB SHOW
IF I$="B" AND MARKER > 0 THEN DEC MARKER : GOSUB SHOW
UNTIL FALSE

SHOW rem sub routine to show 22 lines of text

DUMMY=MARKER
CLEAR SCREEN
FOR N=0 TO 21
LOCATE 0,N
PRINT TEXT$(DUMMY)
INC DUMMY
NEXT

REM **** DRAW A BOX X1,Y1 TO X2,Y2 ***************

RETURN
******************************

OK very rough and a pretty unusable routine, but it should be
readable to even a beginner at basic,

THE TASK
```

Make a scrollbar, so the BOX thats REM'D will show the status of
the file, This is a set window lentgh of 180 pixels, the amount of
text could be 10 lines to 10 000 lines, how would you make a
workable scroll bar, not interested in how to draw it, or how to
work it, just interested in the correct X1,Y1 AND X2,Y2
coordinates that should be the correct top left and bottom right
corners of the box no matter how for into the text you are, ie:
what status the MARKER variable is at,

NO RULES but it must be BASIC not C (get your own compo <vbg>)

it is possible, see issue one of FOCUS diskzine and you will see
that i have used a perfectly working scrollbar, but it took ages
to make, months to figure out, so theres your task :)

Cheers......!ynoT

> what status the MARKER variable is at,

Let w1 be the pixel width of the 'base 'box and w2 the width
of the 'progress bar'.
w2 = int( w1* (Marker)/(MarkEnd-21)) :rem end can be reserved

x1,y1,y2 of the progress box are the same as the base box.
If w2 is truncated to an integer value, then x2 = x1 + w2% where:
w2% = (x2base-x1)*Marker/(EndMarker-21)

base drawn with x1,y1,x2base,y2 parameters [and hollow ]
progress drawn with x1,y1,x2,y2 parameters [and a fill]

exact code depends on your basic.
```

: it is possible, see issue one of FOCUS diskzine and you will see
: that i have used a perfectly working scrollbar, but it took ages
: to make, months to figure out, so theres your task :)

Relatively simple. All you have to do is turn the number of lines in the text file into a percentage and then determine the positioning of the scroll bar relative to the percentage into the file the user is currently at.

Let's say, for example, the scroll bar is 10 pixels tall, and the window within which the scroll bar sits is 110 pixels -- just to make it easy. That gives the scroll bar 100 possible positions. Now let's say that the text file is 1000 lines long -- also to make it easy. This means that for every pixel the scroll bar is moved up or down, the user will move up or down 10 lines in the text. Therefore, the user would have to allow the text to scroll 10 lines when (s)he clicks on one of the scroll arrows before the scroll bar moves one pixel.

So, if the user dragged the scroll bar down to the middle -- precicely 50 pixels down -- that user would end up with line 479 (500-21 lines of text displayable in the text window) of the text at the top of the window -- or line 500, depending on how you define the top variable and, therefore, the dynamic positioning of the scroll bar. (You could define top as either being line 21 -- or the last line, if the text is smaller than 21 lines -- or as line 1)

I could whip up some code if necessary (in GFA) but here's the explanation of how it's done, anyway. (I had to wrestle with it myself when I wrote Fansi. :-)

Did you bother to do any garbage collection?
Whenever I have that sort of thing it looks like...

ERASE var()
~FRE(0)
DIM var(big)

Another thing that trips people up is the fact that GC anywhere may cause your
variables to move about, so that

a%=V:var(0)

may be valid for a while, but then var() might be moved, and a% points to
something else.

:
Use the blitter if you can do 2d blits or full screen blits. Yes you can use the blitter in TC as a replace mode blit ONLY. Set it up as a 1bit blit and work from there. I think I uploaded something to GEnie a while ago that demonstrated blitting on the Falcon.

With blitting, you can increase the performance to up to 12kb/sec in HOG mode.

Date: 1996-02-24 00:00:00 UTC
From: Steph@wuss.demon.co.uk
Message-ID: <825264824_OASIS_@wuss.demon.co.uk>
Source record: 9945

Tony, Tony, Tony!

Thank you for supplying this teaser. However, I wrote a routine like this a while back, so thought was unnecessary (thank god!)

Here it is:

```
PROCEDURE sidebar
PBOX 608,18,622,154 ! Gives a nice white box
ratio=138/endline% ! No of pixels/No of lines
pagetop%=INT(ratio*(topline%-1))+17 ! Top of white box
pagebase%=INT(ratio*baseline%)+17 ! Bottom of white box
IF pagebase00000006agetop%<5
temp%=INT(ratio*(topline%+10))+17 ! This routine sorted out a
IF temp%<20 ! minor bug, but I can't
temp%=20 ! remember what. It might be
ENDIF ! unnecessary. It might be
pagetop%=temp%-2 ! pivotal. I should comment my
pagebase%=temp%+3 ! code when I write it, & not
ENDIF ! 3 years later....
DEFFILL 1,2,2 ! This is a dotty menubar fill
PBOX 607,17,623,pagetop% ! Draw the top grey box
PBOX 607,pagebase%,623,155 ! Draw the bottom grey box
DEFFILL 0,1 ! Back to reality
RETURN
```

This is perhaps unconventional in that it draws the two shaded boxes rather than the single white box. There's no particular reason for this, other than the number of DEFFILLS.

I know that the INT commands are largely redundant because I am using integer variables, but I like to write neat code :o)

>
> NO RULES but it must be BASIC not C (get your own compo <vbg> )
>
```

Here is the basic routine written in generic pseudo (personally I use GFA). As window length was stated I created the routine for a horizontal scroll bar, just swap x,y & x1,y1 to make it vertical.

```
PROCEDURE scroll_bar(mlines%,tline%,width%,vlines%)
' parameters
' mlines = total number of lines loaded
' tline = top line of current screen
' width = total width of scrollbar range ( stated as 180 )
' vlines = total number of lines displayable
LOCAL box_x%,box_y%,box_x1%,box_y1%,a#,scroll_x%,scroll_x1%
box_x%=0
box_y%=0
box_x1%=width
box_y1%=10 ( just to give it some height )
a#=(box_x1%-box_x%)/mlines
scroll_x%=a#*tline%
scroll_x1%=scroll_x%+(a#*vlines%)
DEFFILL 1,0 ( white box black border )
PBOX box_x%,box_y%,box_x1%,box_y1%
DEFFILL 1,1 ( Black Box )
PBOX scroll_x%,box_y%,scroll_x1%,box_y1%
RETURN
```

Drawing it is a doddle, the challenging part is to move it with the mouse so it stays inside the range bar and can move from one end to the other and feeds the coordinates back. Also clicking on the range bar moving the page in the right direction AND the final part is to update the

screen as it goes so that you can watch the text scroll as you move it.

If it is worked well you should be able to move the text cursor on the screen by moving the scrollbar.

I had to write a very small text editor for OASIS <70K but it had to handle any ATARI 16 bit computer with full GEM control with resources, MagiC, the usual word processor functions, block manipulation, Word wrap etc and can handle files of any size (actually the limit is 99,999 lines). It isn't everybodies cup of tea but then no program is.

What I have just finished was really hard - Try writing a multitasking GEM program with full TCP/IP systems (not one that runs in a multitasking environment - but is fully multitasking in itself, Menus Windows & Dialogs). Done in GFA basic.

The language isn't important it's the ideas that use it that are!

2260. AES 4.1 drop down listboxes

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-25 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4go9ud$71e@inca01.inca.co.nz>
Source record: 9949

I have recently struct a bit of trouble with AES 4.1 listboxes.

If I disable the very last item in a listbox, it comes out in a "disabled button" colour, rather than just greyed text on the background colour.

If I disable any other item in that listbox, it comes out as grey text on whatever the background colour is.

This looks very odd, when the rest of the popup is flagged as FL3DBAK. Each of the affected ones are flagged FL3DBAK as well.

The listbox has fourteen items on it, all of type G_STRING, with four or five of them disabled.

Doing it as a normal popup menu seems to cure it.

Has anyone had any similar experiences like this?

How does one get around it? (other than doing it as a normal popup)

(I am using Lattice C 5.6, MultiTOS AES 4.1, MiNT 1.12 with memory protection 'on', on a 20Mbyte TT in TT-Medium rez).

: Did you bother to do any garbage collection?
: Whenever I have that sort of thing it looks like...

: ERASE var()
: ~FRE(0)
: DIM var(big)

I'd forgotten about garbage collection; thing is though, I don't think
that was the problem; the problem recurred at exactly the same place
every time, and in precicely the same way. It was too regular and
precice to be a garbage collection problenn.

: Another thing that trips people up is the fact that GC anywhere may cause your
: variables to move about, so that

: a%=V:var(0)

: may be valid for a while, but then var() might be moved, and a% points to

I don't think that was it, either, but I'll keep that in mind. I've made
the array static now, so the probem hasn't recurred, and if I run into
more probllems I may just use malloc() instead.

I agree. As we all can see, it's almost impossible to write a game
using real texture mapping on an amiga, just because of the lack of
chunky pixel format (ok, there are some tricks for it like using the
chopper, but they all have their limitations).
IMHO, the 16-bit-mode fits best for games on the falcon. Even if it
means to code in assembler. BTW, there's still a DSP around to do
some of the heavy work...

There is some floating around in the Programming section of a.a.u.e. I
couldn't tell you exactly which ones they are though. I remember seeing a
couple when I was indexing it last year. If you grab the 0index, I think
I noted which ones were HiSoft Basic.

Sorry I can't be of any more help,

From: johngr@teleport.com
Message-ID: <4gqibm$k7s@maureen.teleport.com>
Source record: 9955

I'm tring to fix some programs I wrote afew year ago. One problem I have is I get flicker on my scrolling program. I am using Vsync and Set screen and coping screens to the buffers can the switch. but every so often get flicker near the top of the screen. This happens on both my STFM and Falcon. I basicly copy the next screen to logical page, vsync then switch logic/physical then do the same for the next screen.

Is there a faster or flicker free way to do this that will work on both systems. I can't think of any other way with the 256byte restriction for screen boundaries on the STFM.

Thanks

John

Source record: 9956

Tony,

If you are looking to play about with a different flavour of Basic, why not try out GFA? Asides from my obvious bias, it really is a powerful version of basic, and it forces you to write really structured code. Good training for when/if you switch to a 'real' language (as MarkB would say!)

The other advantage of trying GFA 3.6 is the number of people who use it and can give you support & false information in equal measure :o))) Guess which bracket I'd fit into....

Seriously, though, I'm a bit of an amateur, but I know my way around the language. There are a couple of experts floating around. For instance, Oasis & Oasis 2 are written in GFA 3.6, so those two must be a bit handy. And you might have noticed others on this group & c.s.a.s. talking up a good game! :o)

This isn't intended to start a flame war between languages; I just assumed you were interested in other Basics because of your question. I don't know anything about HiSoft.

My opinion, that's all..

Steph.

>bracket I'd fit into....

I really don't think I should reply to this bit :)

>you were interested in other Basics because of your question. I don't know
>anything about HiSoft.

Hisoft basic is better for GEM stuff, particularly if you have Ofir's toolbox.
Apart from that there's not much to choose between them really, it's just
whichever you prefer.

2269. GFA Queries

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-26 00:00:00 UTC
From: cb170@city.ac.uk
Message-ID: <4gr18b$kio@bambam.soi.city.ac.uk>
Source record: 9958

Perhaps someone could help me with a couple of GFA problems/queries:

Firstly, I've been having problems getting the VA_START protocol working - specifically in finding the path/file that is passed when a file is dropped onto the program icon.

I get the VA_START message and the appropriate details in the message buffer fine, with the hi and lo words of the address. When I concatenate the two words, it gives me an address, which I can then read with filename$=CHAR{address%}.

This works fine when both numbers are positive, and I get the correct filename. However, recently I have started to get negative numbers in the low word of the address, almost always resulting in a crash (bus error) when reading the file string ('cos it's getting the address wrong). Typically I get values of 25 for the hi word and around -2756 for the low word.

Anyone have more info on this?
(BTW I'm using MagiC 2 and Gemini 1.999)

**

Also, can anyone shed a bit more light on the compiler settings - specifically, which ones should be used and which should not. I'm writing Line-A free MagiC compatible, modern flydial interface Gem apps with Gregor Duchalski's Flydials.

Cheers!

2270. Hacking executables (read, don't just flame)

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-26 00:00:00 UTC
From: jat5@york.ac.uk
Message-ID: <4gs4uj$ei@netty.york.ac.uk>
Source record: 9959

I have a piece of software that drives a piece of hardware attached
to my Atari (it's the Lynex 16 bit sampler if you must know). Now, I
have a problem: The software is very unreliable, and also has features
which I don't use - it also lacks features that I would like. After
(approx) 2 years of searching, I have found no-one who has heard of this
hardware, and no help whatsoever. Which brings me to my question:

Is there a recognised way of `reverse-engineering' the code? I managed
to disassemble the code using GFA assembler, but I don't really understand
the format of ST executables - the disassembled code has a load of jump
instructions at it's start, now I don't know whether these are real
instructions, or a data storage area. I haven't done much assembler!

Any hints, tips etc. (or better still, someone who has some source code
for the Lynex sampler - I still live in hope) will be gratefully
received.

cheers,

john..

2271. Problems with close virtual workstation

Newsgroup: comp.sys.atari.programmer
Date: 1996-02-26 00:00:00 UTC
From: David White <david.white@rd.eng.bbc.co.uk>
Message-ID: <4gs0nn$79b@bbcnews.rd.bbc.co.uk>
Source record: 9960

I'm having grief with the vdi function "close virtual work station" (I can't remember the C function name off hand). NVDI3 complains that I pass it an invalid handle but I can't see what I'm doing wrong. Here's what I do (important details only):

```
1) call appl_init()
2) VDIhandle = graf_handle()
3) ScreenHandle = VDIHandle()
4) ScreenHandle = v_openvwk(...,&ScreenHandle, ...) /*or whatever
the function name*/
5) event loop till quit
6) v_closevwk(ScreenHandle)
7) appl_exit()
```

NVDI pops up a dialogue box informing me that I gave it an invalid handle. The documentation I have says that this is the correct way of doing things.

STOSSER WWW Page
http://www.airtime.co.uk/users/stosser/

This page has now been updated, Some major changes have been made, the <Downloads> section now has its own menu system, from here you can now download all 25 issues of STOSSER Diskzine, all 4 issues of STESTOSterone diskzine, a selection of STOS extensions and a selection of my titles, including H.E.R.O. Multiplayer Pakman and VidIgrid 2, other titles by myself can also be downloaded,
Couple of more people added to the <Bit about> section, please note anyone in this section directing others to there "bit" should use the normal url but change your name to uppercase,
A new section added on the main menu and smaller updates to existing sections, there now totals Seventy Nine (79) seperate pages on this one site,

This will be the last major monthly change now that I have a working ftp client ie: MG-FTP for use with STiK, I now dont have to wait a month, with my STe I can now update the page as often as I wish, and indeed will be doing, so keep your eye on the date when you visit :)

Cheers......!ynoT

Source record: 9962

Sorry to be a bit blunt here, but could you possibly explain a little more clearly exactly what it is you're trying to do since I'm not sure I've understood correctly. I assume that you're just trying to do double-buffering - ie, display physical screen, draw on logical screen, wait for the vbl, then swap screens. If your code runs in less than 1 vbl, then you can put in a new vbl routine at $70.w:

```
vbl1
move.w #1,vbl_flag ; flag the vbl's happened
... ; any other code
move.l #phy_screen2,$ffff8200.w ; display physical screen
move.l #log_screen1,screen ; draw on logical
move.l #vbl2,$70.w ; next vbl
rte

vbl2
move.w #1,vbl_flag
...
move.l #log_screen2,$ffff8200.w
move.l #phy_screen1,screen
move.l #vbl1,$70.w
rte

; This routine will wait for the vbl to occur
clr.w vbl_flag
wait_vbl
tst.w vbl_flag
beq.s wait_vbl

log_screen1 = address of screen 1
phy_screen1 = address of screen 2
log_screen2 = shifted address of screen 1 (for hardware)
phy_screen2 = shifted address of screen 2 (for hardware)
```

Whether this works on the Falcon I've no idea. But you get the idea. If you really need to get around the 256-byte restriction on the STFM, then you can always sync-scroll, which allows you to start the screen address on an 8-byte boundary. See the Mindbomb main menu for a good example of this. Or some of TCBs screens.

You say you're copying screens to the buffers. What do you mean by this? If you could give a more detailed explanation of what you're trying to do it would be a great help. Is this a game? Demo? There are _many_ techniques for speeding up what you're doing, but often they are restricted to certain things.

I've had hour-long debugging sessions finally ending in finding that
the include file _before_ the offending one had a missing ; or
something. You could check that out.

<rant>

Be careful when you start assuming "product X" was written in "Language
Y", and therefore Y is a very good/bad language.

This is a completely incorrect inference. The skill of the programmer is
paramount here. A good programmer behind a crap language can do just as
well - if not better - than a crap programer behind a much better language.

(I have heard such opinions ["X uses Y, so Y is good/crap"] before, and
find the tadger-comparison that the language wars devolve into ["L has
GOOGOL, but Q doesn't, so Q sux Ls appendage"] tiring to wade through).

</rant>

(Not wishing to attack you or your post in particular, but it did mention
an "X written in Y", from which the capability of Y can be inferred by the
lazy/ignorant)

This is quite simple.
All you have to do is add 0x8000 to each value, and
the sign extension will cause the negative values to wrap around,
be careful with BASIC though, since it might not do what you expect.
In C and Assembler it works.

What do you mean that it trashes the screen. If you're trying to change the
desktop resolution it won't work that way, since GEM don't know that
the resolution is changed.

What you have listed appears to be valid code - although step 3 seems a
bit suspect. It could also be a bug in NVDI.

Here is what I use (suitably trimmed)

```
appl_init()
vhandle = graf_handle(...)
v_opnvwk( wi, &vhandle, wo )
evnt_keybd()
v_clsvwk( vhandle )
appl_exit()
```

John 'john..' Tuffen <jat5@york.ac.uk> wrote:
> I managed to disassemble the code using GFA assembler, but I don't
> really understand the format of ST executables

The header of an executable is:

struct programheader {
u_int16_t magic; /* always 0x601a (bras) */
u_int32_t textlen; /* length of text segment */
u_int32_t datalen; /* length of data segment */
u_int32_t bsslen; /* length of bss segment */
u_int32_t symlen; /* length of symbol table */
u_int32_t reserved;
u_int32_t flags; /* program load flags */
u_int16_t no_reloc_info; /* if != 0, the code is */
/* position independent */
}

The text segment immediately follows this header. The data segment
immediately follows the text segment. The symbol table immediately
follows the data segment. The relocation info immediately follows
the symbol table.

The text segment may of course contain constant data, but contrary
to the unix a.out format there is no entry point in the header,
hence the text segment must start with an instruction.

Well, not so much of a teaser as a whole game :)

Has anyone seen Worms (made by Team 17) on the Amiga or PC?
(a cross between tank wars and lemmings - awesome game!)

If you haven't then you should have a look at it and become enlightened :)
If you have... I propose the challenge of writing it for the 1 MB+ STE /
TT / Falcon - with enhancings for each system :) - you may
(actually probably will) have to get permission from Team 17...
you can email them at
dudes@team17.com
whether you get any response from them is another story...
I will post other adresses as I get hold of them

I'll have a look, but I doubt if that is the problem. I only have one header
file that is created manually by me, the other headers are the AES, VDI and resource
file headers.

That is exactly the same, I just retain the original handle in case I ever
open another workstation (eg, for printing). As for it being a gug in NVDI,
mine seems to be the only program that comes up with it.

Sorry to be so negative. But w/o knowing much assembler you're probably
just wasting time. Honestly.

The TOS header looks like this:

typedef struct
{
word magic; /* 0x601A */
lword text_len, /* size of text segment */
data_len,
bss_len,
sym_len,
res1,
prgflags;
word abs_flag;
} tos_header;

If you really wanna disassemble this, use these hints.

1) replace all absolute addresses (like Hardware / lower memory)
with symbols (like MEMCONF etc.) replace all relative
addresses like $136784 with L_136784

2) identify subroutines that issue TRAPs. Find out what the
traps do, name those subroutines

3) find strings, name their addresses

4) Now from the start try to analyze whats happening, ignore
big functions for now. Look for the little shit like memcpy
, getenv strcmp et.c.

5) Keep the CD player spinning all the time :)

Expect to spend _quite_ some time doing this, if you've never done this
before. The benefit in the end will be that you understand the program
better than the original programmer ever has (no joke).

Nat!

>Y", and therefore Y is a very good/bad language.

Certainly, but as there was no mention of this sort of thing, where's the problem? I am pretty capable of figuring that out for myself, but thanks for pointing it out.

>
>This is a completely incorrect inference. The skill of the programmer is
>paramount here. A good programmer behind a crap language can do just as

It was the skill of the programmer that I was commenting on. What I like to do when I'm reading something is to let the words transfer their meaning, and avoid trying to paste my preconcieved ideas on top of some stand-out words in the text - is this something that you could usefully employ in the future?

>well - if not better - than a crap programer behind a much better language.
>
>(I have heard such opinions ["X uses Y, so Y is good/crap"] before, and
>find the tadger-comparison that the language wars devolve into ["L has
>GOOGOL, but Q doesn't, so Q sux Ls appendage"] tiring to wade through).

I appreciate this. I am sorry, perhaps I should have e-mailed Tony directly on this matter. However, yours is the only reply to this (asides from 1 humorous one), and therefor the only one likely to start an arguement.

> ></rant>
>
>(Not wishing to attack you or your post in particular, but it did mention
>an "X written in Y", from which the capability of Y can be inferred by the
>lazy/ignorant)

Ha. Which bracket do you fit into then, Mr Misread?

I stated quite clearly that I knew nothing about Hisoft 2. I made no comparisons between languages. I made a recommendation based on 2 salient points; firstly, I know the language (GFA), and secondly, I know some people

are quite expert in that language and could offer the sort of help that Tony was looking for. No more, no less.

Please don't take this post as any more of a personal attack on you than yours was on me. A suggestion though. If you do want to flame the arse off of me, e-mail me direct. I'm sure most of the group don't want to read a private bickering match between me & you.

A puffed-up & self-righteous Steph.

>starting address. Any ideas on how to do this using sozobonX.

It may support something along the lines of 'asm' for inline code but
the best way to do it is to have the assembler in one file and the C in
another. As you haven't done this before then you can get the compiler
to help you once you have found the correct options ...

E.G.

```
main()
{
printf("Hello ");
asm_bit("there ");
printf("World\n");
}
```

asm_bit() will be in assembler. Write a nearly blank routine in a
separate file which has the required arguments ...

```
void
asm_bit(s)
char *s;
{
s = NULL; /* forces the compiler to access the argument */
}
```

and tell it to generate assembler which will produce (in my case,
yours will probably differ) ...

```
cc -S asm_bit.c
```

which produces asm_bit.s containing ...

```
globl asm_bit_

asm_bit_:
link a6,$0
clr.l 8(a6)
unlk a6
rts
```

The compiler has generated to basic prototype for you and makes the
asm_bit() function accessible to be called like any other C function.
A nice and neat solution. All you have to do is insert your assembler.
The original asm_bit.c can now be deleted.

```
globl asm_bit_

asm_bit_:
link a6,$0 /stack frame for locals (none here)
/clr.l removed, its done its job of telling
/us arg 's' is at 8(a6)

/code to move arguments asm_bit() arg list
/to correct places in your code below

movem.l ?,-(sp) /save appropriate registers

/insert or jsr to your code here

/restore saved regs

unlk a6 /kill stack frame
rts /to main() in this case
```

All you have to do is find the correct switches to make your compiler
generate assembler and experiment with trivial examples for a bit to
find out how varying arguments are passed. You of course will have to
find out about the compiler's register usage.

and compilation should be a simple equivilent case of

```
cc -o example.prg main.c asm_bit.s
```

Provided you have not messed with critical compiler registers your
assembly section can easily call other functions ...

```
globl asm_bit_

asm_bit_:
link a6,$0
move.l 8(a6),-sp
jsr printf_
addq.w $4,sp
unlk a6
rts
```

I hope some of it makes sense!

>bod out there with the answer?

What I said still goes, v_opnvwk() returns void so that is going to
crop up as soon as the call works. The following has just this moment
been compiled and tested to be *doubly* sure ...

#define DEF_VDI /* simply a conditional macros which defines
* my intin,intout arrays etc */
#include <gem.h> /* your equivilent of aes.h and vdi.h */

main()
{int wki[11] ={1,1,1,1,1,1,1,1,1,2},
wko[57],
nowt,
vh;

/* this could be a cause of invalid opcode */
/* no appl_init() = no Gem calls */
appl_init();

/* obtain physical screen handle */
vh = graf_handle(&nowt,&nowt,&nowt,&nowt);

/* convert to virtual screen handle */
/* NDI has 128 workstations iirc */
v_opnvwk(wki,&vh,wko);

/* check for vh failure omitted!! */
```

```
/* prove we've got a valid workstation */
v_gtext(vh,160,100,"Hello World");

/* close it */
v_clsvwk(vh);

/* allow AES to free system resources */
appl_exit();

/* success */
exit(0);
}
```

If this fails check that your int size is really 16 bit and not 32 bit.

Even my K&R compiler will not allow me to assign results from void functions to anything. Check that the header has been pulled in and that all is defined and that it is defined correctly. It is not unknown for headers to be wrong. v_opnvwk() is void, reguardless of what your header has it defined as.

From: dhedberg@yin.kuai.se
Message-ID: <4h4ne4$q71@kaon.kuai.se>
Source record: 9986

: Summed up that the Falcon are much funner to use than bulky windows, and
: much slicker than even pentiums, it's well worth using. And if you look
: at the new game from Sweden, Willy - The adventurer, you can see that
: really good games on the Falcon ARE possible!!!

Thanks! We are doing our very best... btw, the name of the game have been changed to "Willie's Adventures". I just got to mention one thing about bitplane vs. TrueColor mode. You can't really say that any of these modes are quicker than the other. It all depends on what you are planning to do on the screen. It would be impossible to do "Willie's Adventures" in TrueColor for us for an example. The TrueColor mode is great for doing texturemapping and effects like that, but not very good for games like ours. Drawing bigger sprites in TrueColor takes more processing time compared to bitplane mode, and in bitplane mode it's also possible to make use of the different bitplanes to do things like parallax scrolling, something that definitly is impossible in TrueColor mode (of course it's possible but not in full frame rate).

Anyone that are interested in our Falcon030 game but haven't found it. Take a look at <ftp.uni-kl.de> or <ftp.cnam.fr>. It will also be available on our homepage pretty soon.

>Still not sure if my conclusions were correct, still want to know
>what was wrong with my other efforts and still curious to hear about
>similar experiences.

On any atari machine you can set the screen address at any one time.
The change occurs the next VBL, that is, BEFORE the VBL interrupt
uccurs. This means that you actually set the screen address to the
screen you want to write on at the beginning of the VBL.

Vector $70 contins a pointer to the VBL interrypt. That is, the interrupt
that gets calles every time AFTER the screen address has been read and
set from the screen address pointer.

On the STE and onward (TT, Falcon) the video address counter is no
longer read-only, which means that you can set the screen address
in the middle of the screen, effectively making half the screen
hardware scrolling while keeping another half of the screen static.

>does not show the dialogue again if I re-run my program.

It sounds like you are corrupting the handle somehow. Make sure the
value set by v_opnvwk() is the same when v_clsvwk() is issued. If the
above example does not work then make doubly sure your ints are not 32
bit.

If the above example works but your code does not then it looks like
you are on your own. Beware of blit operations, they can easily get
out of control.

: the format of ST executables - the disassembled code has a load of jump
: instructions at it's start, now I don't know whether these are real
: instructions, or a data storage area. I haven't done much assembler!

I regularly disassemble software using HiSoft's MON (comes with Devpac). Under mon you can see a memory map (ASCII/Hexadecimal display) as well as the disassembled code. Using these together, it is possible to work our where any data sections are. For example, addresses always are 4 bytes long, the first byte being 0 - very few instructions look like that.

Executable files are split into three sections: code, data and bss. The code section is generally filled only with instructions and comes first in the program (the only problem is, some programmers see fit to jam data into the code section which is really bad practice IMHO ;). The data setion is filled with, err, data.. :) and the bss section is just blank space.

You can find the lengths of these sections by pointing the memory window of the debugger to be 256 bytes before the start of the program. You will see a bunch of long words there - this is the base page of the program. You can find the full format of the base page in most GEMDOS manuals. Atari Compendium has a really good description, as does the Devpac manual (I think Modern Atari System Software does too).

You can get mon to disassemble the thing out to disc - including labels. If the symbol table is missing from the executable (quite normal) then it creates on using the addresses of the symbols.

The worst software to debug is Turbo-C compiler stuff - it's awful! GFA Basic compiled stuff is also completely unreadable. GCC compiled stuff, however, is a dream!

Happy hacking,

James Cox

I never programmed the Falcon blitter (nor the Falcon...). However I did program the blitter found in MegaST and STE. The way it accesses the RAM is on a 4 cycle per word (16 bit) per cycle; so to move a word it requires 8 cycles that is 4 cycles per byte. If I remember correctly the Falcon's blitter runs at 16 MHz (or 8 if one wants); that gives us 4.10^6 per second i.e. 80 000 bytes per VBL. On top of that the blitter and the CPU share the same bus to the RAM. However with a program running in the caches the 68030 could still run (one could make intensive simple integer computations while blitting); the RAM bus of STE can be split in the following way: 64 cycles for blitter, 64 for the CPU.

And the only Falcon programmer I know (he wrote a famous game...) said the blitter is almost useless (that's different in an STE whose CPU is much slower).

What does the VDIhandle _function_ do?

I guess you really meant to copy variables re: "ScreenHandle = VDIHandle"

> > > 4) ScreenHandle = v_openvwk(...,&ScreenHandle, ...) /*or whatever
> > > the function name*/

v_opnvwk() is documented as returning VOID (nothing, rubbish, cr"*).
Unless you are using a customised func called "v_openvwk".

I was referring to the VDIHandle function you were apparently calling in
step 3. Admittedly you probably meant to assign the value of a variable to
another variable.

Fair enough.

How many virtual workstations are you opening? Would the computational overhead of calling graf_handle and v_opnvwk in sequence be any problem compared to calling graf_handle once, and reusing the saved screenhandle on each successive call to v_opnvwk?

I haven't had any bother using the former approach under TOS 1.2 on a Mega ST with about half a dozen.Likewise, on a TOS 3.05 TT with MultiTOS, it appears reaasonably bulletproof up to the mid twenties (24 I think is as far as I tested - it may be more).

You coud just try "single tasking TOS"

Another way is calling the single tasking TOS just TOS and calling MultoTOS MultiTOS. This might confuse some DAUs but They can-t say it's wrong...

Christof

2310. Single/Mono/Uni TOS?

Newsgroup: comp.sys.atari.programmer
Date: 1996-03-04 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4hf3nt$3gs@inca01.inca.co.nz>
Source record: 9800
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

Over the last few years, while writing documentation for custom ST/TT applications I have written, I've needed to describe the various versions of TOS that they (the apps) were designed for.

Up to a few years ago, all versions of TOS were single-tasking, so simply saying TOS x.xx was OK.

With the introduction of MultiTOS, I struck a problem.

Some apps are better suited to a multitasking environment (a background disc formatter/disc copier, for example, that I have written, and will be ready for wide beta/gamma testing soon)

MultiTOS obviously implys a multitasking version of TOS. But how then does one refer to a single-tasking TOS?

Reading the Atari newsgroups, it appears that the default name for it is "single TOS". But that doesn't roll off the tongue quite as well as it could (read: it doesn't quite sound right). I guess that I may have missed a discussion that eventually settled on using "Single TOS".

I have started using the phrase "Mono TOS". Some have even suggested to me that it might be better calling it something else, as it can be confused with "monochrome" TOS. Also, certain persons (PSD in c.s.a.a) would probably be able to come up with a few sharp-tongued rephrasings of "MonoTOS".

"Uni-TOS" is a variant that might have some possibilities. Although that too has possibilities for denigration.

I am therefore looking for ideas on how one can describe a single-tasking OS version.

So, consider this article as a trawl for ideas to call single tasking TOS. (Rude or insulting comments can be sent to /dev/null)

: own without slowing the cpu down. I'm I correct ?

The blitter in the Atari computers is pretty much useless yes, it can
share the bus or run in hog mode. If you run it in hog mode the blitter
uses the whole bus and you're able to do particulary nothing with the CPU at
the time. I can't see much use of the blitter but shifting big blocks if
you're in bitplane mode. There do exist some tricks where the blitter can
be very useful, though but the blitter isn't very fast on moving data, and I
must say that I find 480kb/vbi very unlikely to be true. I'm not sure,
I have the correct figures, but on an unaccelerated Falcon the blitter
isn't capable of moving more than around 50-60kb/vbi from memory to memory.

> could assist!

I don't know what version of pack-ice you are using (this is the
pack-ice by Axe of Delight?) but in my day(circa 1991) it didn't ask you
to specify relocation explicitly...

Anyway, the point is that if the OS loads up a program, then it takes a
whole bunch of addresses as specified in a table at the end of the
image, and adds the load address to them, thus the code will run from
the loaded address.

If you pack the program as a program, then ice pre-pends a
depacker/relocator onto the executable, which depacks the program and
relocates it.

If you pack a datafile which you are going to depack yourself
(including a program that the OS isn't going to load), then there's no
point in putting the relocator, or the depacker, on.

The only time I can see where you would not put the relocator code into
a program is if the code was position-independent, ie. it is all written
using pc-relative instructions.

Hope this answers your question, and that I'm not just ranting on about
the wrong thing 8-)

Well I use version 2.4 which I understand is the latest (and I guess
lfinal) version of Pack Ice. A depacking routine is supposed to be
available with the packer but it is the source, not a compiled version.
The idea is that programmers depack from within their programs, you can
do this (in STOS) with a number of extensions. To depack to the
MegaDepacker which recognises most, if not all, version of Pack Ice.
Glad to have helped you as well as me with this question Tony :-)

>What/who is/are Bad Mood?

BAD MOOD is the name of an internet project to create DOOM(tm) compatible
game for the Atari Falcon030.
The game is (and will continue to be) FreeWare and full sources are
available.

A couple of minutes ago, I made the v2.02alpha binary and the v1.93alpha
sources available on the WWW/ftp site (see .sig).

BAD MOOD 2.03alpha will let you walk around in the 3D world defined by a
DOOM, DOOM2 or Heretic WADs with fully textured walls, floors and ceilings.
This is all done in Falcon TC mode, so the light effects look a lot better
than in the original.
(There's no texture mapping of the sky yet and the transparent textures are
still opaque (fixed in 2.03alpha).)
Since the original textures are used, you must run this version with a
WAD containing those. If your WAD is less than a couple of megabytes, it is
unlikely to do so.

No sprites, sounds or any kind of game play are available yet.

For further information, see the WWW page.

What you can do is add a Reply-To: header with your e-mail address to your articles. I think your newsreader (tin) can do that automatically for you. You probably have to set some environment variable, or add the header to a configuration file. Being a trn addict myself, I don't know the exact way to do it. The readers of news.software.readers will surely be ably to help you.

Hi Waldi
I have had a go at sorting it, I have changed over to Oasis Nos so
that might help, I actualy tried to send an email to stosser@neon and
it arrived in my mailbag, just try a test mail :))
You dont have any Hisoft Basic 2 source while your there do you :))

If anyone has written and I havent replied then its this thats the
problem, i actualy reply to every email i get, if anyone has sent me
any source then it never arrived ?

Cheers.......!ynoT

Hi,

Thanks to the help of different people, I just found It in 2 different
location.
ftp.imc.exec.nhs.uk/pub/atari
and
ftp.fu-berlin.de/pub/atari/mint/contrib-package/mdk.new/mint030.zip

I thank them very much.

Ph. CASTELLA

PS: mint030.zip exists on several FTP sites but in general gem.sys has
been removed from the archive like in FTP.CNAM.FR

Elias Martenson wrote:

> If i remember correctly, there is no floating point support in Sozobon.The docs with sozlib15 say:
"The standard library modules are to find in the files 'libc.a' and 'libextra.a'. The last one contains rarely used functions and extensions to the C standard library. With this release 'libc.a' contains all floating point code, too."
and:
"libm.a The Mathematics Floating Point Library...The library itself is a port of the 'pml' - portable math library by Fred Fish."
Unfortunately Andrew Thackrah is correct, this seems to be missing from the distribution. Earlier versions of SozobonX should include it. I have not investigated far enough to know whether it is still necessary.

I tried sending you email awhile back before I went on vacation and it
just bounced.

I scanned through the Programming section on a.a.u.e and only found the
following:

rez_rgb.asc 5 Document further detailing Hisoft Basic res calls

Guess I didn't note them as well as I thought. Try Hensa, I believe I
saw some there. I know there are a few more files floating around the
net. But when you are doing a brief description sometimes extra info like
this gets lost. You could try looking at the GFA Basic code there is
quite a big section of it at a.a.u.e. under Programming/Gfa. Alot of it
should be pretty generic and compatible with HiSoft.

Hello peeps

My email adress is stosser@airtime.co.uk
Its in my signiture as well ? :))

If anyone has any hisoft basic source code for me to load, examine and
learn from then please do send, plus any ASCII files on the subject language,

Yes your probably sick of seeing me ask, well having not recieved one
single piece of source then my need is still there and I firmly beliecve
there must be someone out there that can send me source,
I have spent the last few years sending STOS source and help to many
peeps, surely someone in the Hisoft community has the same outlook,
I need help, and am asking,
But no one is responding,

Hmmmm <?>

Cheers......!ynoT

That's because your ISP's mailer, after failing to find a machine
called "neon" will try again after appending ".airtime.co.uk" to
it. No-one else's system would find it, as they wouldn't try
appending ".airtime.co.uk"

: Errrk!
: I disassembled the code again last night - 47000+ lines
: of assembler, with no symbol table. :(
: From what I remember, it looks a helluva lot like it was written in C. Now
: I'm **really** desparate to find some source code...
Oh ! You did ?

So if you need any help, in getting some C-code out of it, I could help you...
All you need to do is sending me the binary UUEncoded, and I'll try to get
it into C-Code, I did that quite a while ago with an other exec, it worked
fine, getting the right compiler, I got exactly the same binary from my
C code conversion !

CU !

MagiC appears correct having it defined as 90 (with msg[3] containing
the child process ID and msg[4] the child's exit code).

Hi there

Johan Klockars (d8klojo@dtek.chalmers.se) wrote:
: Since the original textures are used, you must run this version with a
: WAD containing those. If your WAD is less than a couple of megabytes, it is
: unlikely to do so.

Where is a good ftp site that has a directory clearly identified for the
IWAD files (as I think they are called). I've wasted a lot of $ on ftp
grabbing of PWAD files that don't work with 2.02alpha. Sadly none of the
places I know about describe whether or not the wad files on them are
PWAD or IWAD type...:-(

BTW, the whole project is lookin' like its cookin'!!! Great stuff guys...

>also available on ftp.cnam.fr, I believe. Damned is a fairly
>small file so it shouldn't take long to download. Hope you
>enjoy it and this helps ;-).

If it is 'fairly small' then it probably doesn't work with any
of the newer versions of Bad Mood. From 1.93 (now at 2.03) onwards
it required an IWAD. This is because the floor (both) and wall
(version 2.x) textures are read from the WAD file. Most WADs that
are small are just PWADs, and only contain map data - no textures
or sounds etc.

But it should work with the earlier versions (eg. 1.92 I believe
texture-mapped with only the built in textures, and ignored any
in the WAD).

IWAD's (as required by 2.x etc) are BIG. You can either install
Doom/Heretic etc. onto a PC (or Mac), and use ARJ to split it up
into multiple disks. Alternatively, you can download the .tar.gz
Doom WAD intended for the Unix ports. (this will still need
splitting onto multiple disks of you need to move it, but doesn't
require access to a PC)

Hope this is of some help...

Anthony

> Does anyone know if it is possible to call methods
> in C++-classes from within a standard-C-program?
> If it is, how can it be done?

There is no portable way to call C++ methods directly from C. It may be possible to do so if you're willing to be tied to a specific compiler and a lot of ugliness. Do you have any control over the C++ code? If so, you can generate some functions that are callable from C but are written in C++. These function's can't be member functions, but they can call C++ member functions. Here is the basic idea:

```
---- SomeClass_c.h ----
typedef void* SomeClassInstance;

#ifdef __cplusplus
extern "C"
{
#endif
SomeClassInstance SomeClass_New();
void SomeClass_Delete(SomeClassInstance instance);
void SomeClass_Function1(SomeClassInstance instance);
int SomeClass_Function2(SomeClassInstance instance, float x);
#ifdef __cplusplus
};
#endif
---- end SomeClass_c.h ----

---- SomeClass_cpp.h ----
class SomeClass
{
public:
SomeClass();
virtual ~SomeClass();
virtual void Function1();
virtual int Function2(float x);
};
---- end SomeClass_cpp.h ----

---- SomeClass.cpp ----
#include "SomeClass_c.h"
#include "SomeClass_cpp.h"
```

```
SomeClassInstance SomeClass_New()
{
return new SomeClass;
};

void SomeClass_Delete(SomeClassInstance instance)
{
SomeClass* me = (SomeClass*) instance;
delete me;
}

void SomeClass_Function1(SomeClassInstance instance)
{
SomeClass* me = (SomeClass*) instance;
me->Function1();
}

int SomeClass_Function2(SomeClassInstance instance, float x)
{
SomeClass* me = (SomeClass*) instance;
return me->Function2(x);
}
---- end SomeClass.cpp ----
```

The file SomeClass_c.h is a header file that can be used with either a C compiler or a C++ compiler. It defines an interface using purely C style calling conventions. The implementation of that interface (SomeClass.cpp) is C++ code that forwards everything to operations on a C++ class. I don't show the implementation of the actual class SomeClass; it can be whatever you want.

Hope this helps,

Jim Lloyd

2352. Magic 4 and system clock

Newsgroup: comp.sys.atari.programmer
Date: 1996-03-17 00:00:00 UTC
From: phil@yeadontt.demon.co.uk
Message-ID: <827073946_OASIS_NEWS@yeadontt.demon.co.uk>
Source record: 9842
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

Can any one help?

Whenever I run Magic 4 on my TT the system clock is moved back 2 years,
ie from 1996 to 1994. This only happens on first boot up. So naturally I put
the clock back to the correct date. However when I exit Magic using the
Shutdown option and selecting cold boot, the clock is then advanced 2 years,
so I end up with the clock set to 1998!!!

Has anyone else experienced this problem. More to the point has anyone
cured this problem.

This is the only problem I have experienced with Magic 4, I even have
GFA Basic working (set to single tasking but....).

Thanks in advance for any help.

2353. Jaguar Pads with GFA-BASIC

Newsgroup: comp.sys.atari.programmer
Date: 1996-03-18 00:00:00 UTC
From: schoen@dial.eunet.ch
Message-ID: <4ij7mt$qju@news.eunet.ch>
Source record: 9843

Someone recently posted a question here about how to read
the Jag Pads on a STE or FALCON in GFA-BASIC. Well, here
is how I do it on my falcon (maybe there are better ways):

```
' -------- Get both Jag-Pads ------------
PROCEDURE jaguarpads
'
SDPOKE &HFFFF9202,&HFFEE
pad1_a%=255-PEEK(&HFFF9201) AND 8
pad2_a%=255-PEEK(&HFFF9201) AND 2
'
SDPOKE &HFFFF9202,&HFFDD
pad1_b%=255-PEEK(&HFFF9201) AND 8
pad2_b%=255-PEEK(&HFFF9201) AND 2
'
SDPOKE &HFFFF9202,&HFFBB
pad1_c%=255-PEEK(&HFFF9201) AND 8
pad2_c%=255-PEEK(&HFFF9201) AND 2□
'
SDPOKE &HFFFF9202,&HFF77
pad1_option%=255-PEEK(&HFFF9201) AND 8
pad2_option%=255-PEEK(&HFFF9201) AND 2
'
SDPOKE &HFFFF9202,&HFFAA
pad1_pause%=255-PEEK(&HFFF9201) AND 4
pad2_pause%=255-PEEK(&HFFF9201) AND 1
'
SDPOKE &HFFFF9202,&HFFEE
pad1_steer%=SHR(255-PEEK(&HFFFF9202),4)
pad2_steer%=255-PEEK(&HFFFF9202) AND 15
'
' NOW THE KEY-ROWS, VERTICALLY....
'
' -- left vertical row --
SDPOKE &HFFFF9202,&HFFCC
pad1_1%=255-PEEK(&HFFFF9202) AND 128
pad1_4%=255-PEEK(&HFFFF9202) AND 64
pad1_7%=255-PEEK(&HFFFF9202) AND 32
pad1_star%=255-PEEK(&HFFFF9202) AND 16
pad2_1%=255-PEEK(&HFFFF9202) AND 8
pad2_4%=255-PEEK(&HFFFF9202) AND 4
pad2_7%=255-PEEK(&HFFFF9202) AND 2
pad2_star%=255-PEEK(&HFFFF9202) AND 1
```

```
'
' -- middle vertical row ----
SDPOKE &HFFFF9202,&HFFBB
pad1_2%=255-PEEK(&HFFFF9202) AND 128
pad1_5%=255-PEEK(&HFFFF9202) AND 64
pad1_8%=255-PEEK(&HFFFF9202) AND 32
pad1_0%=255-PEEK(&HFFFF9202) AND 16
pad2_2%=255-PEEK(&HFFFF9202) AND 8
pad2_5%=255-PEEK(&HFFFF9202) AND 4
pad2_8%=255-PEEK(&HFFFF9202) AND 2
pad2_0%=255-PEEK(&HFFFF9202) AND 1
'
' -- right vertical row -----
SDPOKE &HFFFF9202,&HFF77
pad1_3%=255-PEEK(&HFFFF9202) AND 128
pad1_6%=255-PEEK(&HFFFF9202) AND 64
pad1_9%=255-PEEK(&HFFFF9202) AND 32
pad1_raute%=255-PEEK(&HFFFF9202) AND 16
pad2_3%=255-PEEK(&HFFFF9202) AND 8
pad2_6%=255-PEEK(&HFFFF9202) AND 4
pad2_9%=255-PEEK(&HFFFF9202) AND 2
pad2_raute%=255-PEEK(&HFFFF9202) AND 1
RETURN
```

The names of the % variables stand for the buttons -
should be ease to understand

Hope, this helps.

2358. Help needed loading MagiC into Falcon fast ram (Help Don Maples, where are you :)

Newsgroup: comp.sys.atari.programmer
Date: 1996-03-19 00:00:00 UTC
From: Michael Grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DoIC3C.9B@ridgecrest.ca.us>
Source record: 9848

Let's start of right. I'm no programmer.
One of the authors of MagiC said that MagX!boot looks for
"fastram_valid" when it loads. I think he use the expression
$5??. I assume $5?? means where ever the _FRB cookie is located.
According to a sys info file I have, the _FRB in my Falcon
sits at 0x5f465242 _FRB 0x00036028. I looked through the Atari
Compendium and checked all the memory values and magic words that
should be present if the system has fast ram installed. I used
BSS Debug to do this (very nice, I wish I could program :).
I checked memvalid, memcntlr, phystop, memval2, membot, memtop and
other locations that were to have magic numbers if the ram was
valid. Everything seem to be in order. I have no problems loading
applications into fast ram under TOS, and once MagiC is booted,
can load applications from there as well. But I can't get MagiC to
load into fast ram at startup.
The fast ram on my Falcon is on a Mighty Sonic card. The amount of
fast ram gets loaded into the system with a program that calls
itself a VDI patch. This patch installs the FRB and adds the
amount of ram on the card to the system. It is a seperate ram from
ST ram, but apears on the desktop as one number. It can be ran
from the desktop or in the autofolder. I usually run it from the auto
so NVDI and such loads into fast ram. I placed it ahead of MagXboot!
when I tried to get it into fast ram so the flags were there. Yes,
the program flags of MagXboot were set as well.
I would guess
that alternate ram on the FX card is handled in a like way, except
I think that the FX ram is managed by routines burned into eproms,
but Expose and Outside have the same problems with both types of
cards so I figure it is implimented the same.

If MagiC cannot load into systems with this arrangement of fast
ram, it would be a great oversite. As well as the Might Sonic,
the FX, Magmum, Speed Resoluition, Afterburner and Hawk 030
will manage the alternate ram in a simular fashion.
Might just as well go buy a TT.

Or am I just missing something simple ? :)

Mike

>Or am I just missing something simple ? :)
From how I underswtand you, you're looking for a way, to use the Fast-RAM of the Mighty Sonic together with MagiC 4, right ?
Thats pretty simple:
Place FAFA*.PRG in front of MAGXBOOT.PRG in your AUTO-folder, so MAGXBOOT.PRG gets loaded into Fast-RAM. To be able to use the Fast-RAM under MagiC, you have to execute FAFA*.PRG after MAGXBOOT again, so that MagiC recognizes the Fast-RAM. The easiest way to do this, is to create a file called AUTOEXEC.BAT (stupid DOS-Name :-( ) in your AUTO-folder, in which you list all the AUTO-folder-PRGS that should be executed after MAGXBOOT.PRG gets loaded.
That's all!!!!

Frank

2360. TOS 1.4 patches needed

Anyone here using X-Debug?

The reason I ask is that i've bought a second hand copy to use on my TT, and everything works great bar one problem so far.

It works on my Matrix graphics card fine, providing when it boots that I limit it to 2 colour mode and don't try too use any more!!

Obviously this is better than MON.PRG which writes directly to the TT video out (resulting in a need to leave a monitor connected there) but I would like to be able to run it in more than 2 colours without it corrupting the screen display.

Any help or suggestions appreciated.

Spencer

Dear Atari fellows,

our magazine is the only one italian magazine entirely committed to Atari products.
We are interested to stay in touch with all Atari distributors/developers around the world.
We have an "International News" section to cover all the latest news from the world.
Please inform us as soon as You have new products or upgrades available.
Regards.

Manuela Esterni

I can use that menu, but it isn't much use because the desktop seems to get all of the characters wrong using anything but the installed system font (why is this?).Is your problem simply that the dialogue starts off with the "Desktop" button pressed and there is no fonts to change on the desktop? Try pressing the "Window" button to change the window parameters, the list should then be selectable. If this doesn't work, have you got GDOS installed?

AES 4.1 was pirated by someone and is now used by a lot of people.
It has also very lousy multitasking capabilities. Feels like using
Windows 3.1.

There is another one however called oAESis that you forgot to mention.
It is not finished yet, byt it multitasks very well. (for example, it
updates the windows even while in the menus!)

2368. evnt_multi in Lattice C

Newsgroup: comp.sys.atari.programmer
Date: 1996-03-22 00:00:00 UTC
From: dferran@cts.com
Message-ID: <4iuhup$837@news3.cts.com>
Source record: 9858

Hi!

Is there a FAQ somewhere to assist those using Lattice C
(5.6) for GEM programming? My Falcon cheerfully displays
two bombs when it returns from evnt_multi after receiving
a MU_MESAG, and I'm running out of things to "fix".

The Lattice documentation for the Mon debugger gleefully
points out that two bombs represent a "bus error" and
"The causes of the above exceptions (and how best to recover
from them) are given a the end of this section" (Page 212),
yet no such cause-and-recovery information is listed.

<sigh>

[I never got stuck this bad with Mark Williams C <grumbles>.]

Any sources you could recommend for help (other than the
Atari Compendium, which I have) would be appreciated!

This dialogue handles both the desktop style/colour, and the window style/colour. There are a pair of radio buttons to select which is being altered. Make sure the "window" button is selected, because the desktop doesn't recognise font changes, so the popup is greyed out.

Cheers,

Xav

It's multitasking capabilities are infinitely better than the released MTOS AES! Where can I get an alternative to try (even a Beta)? Any Web pagaes out there?

p> years, ie from 1996 to 1994. This only happens on first boot up. So
p> naturally I put the clock back to the correct date. However when I
p> exit Magic using the Shutdown option and selecting cold boot, the
p> clock is then advanced 2 years, so I end up with the clock set to
p> 1998!!!
p> Has anyone else experienced this problem. More to the point has
p> anyone cured this problem.
Hmmm, I experienced clock problems but they were more to do with the time
drifting a couple of hours and eventually drifting a couple of days.

This was a battery problem and was cured by my using a Forget Me Clock II
which I used to use on an ST. Beyond that I have had no other problems.

p> This is the only problem I have experienced with Magic 4, I even
p> have GFA Basic working (set to single tasking but....).
I've also got Protext running fine under Magic (again single task mode,
but....)

For years, I have used the following code for evnt_multi() with MWC,
you should have no problems with it under Lattice ...

You will have to replace stdtypes.h and gem.h with
something else.

```
------------------------ the header ------------------------

#ifndef EVNT_H
#define EVNT_H EVNT_H

#include <stdtypes.h>
#include <aesbind.h>

typedef struct {
int evm_event; /* required events */
int evm_clicks; /* required number of clicks (usually 1) */
int evm_button; /* required button (1==left,2==right) */
int evm_bstate; /* required state (0==up,1==down) */
int evm_m1io; /* 0 == into, 1 == outof, (default into) */
Rect evm_m1; /* default, all set to 1 */
int evm_m2io; /* default outof */
Rect evm_m2; /* default, all set to 1 */
```

```
int *evm_msg;
ulong evm_time;
int evm_mousex;
int evm_mousey;
int evm_mbutton;
int evm_kstate;
int evm_keycode;
int evm_clicked;
} EVM;

int Evnt_Multi(/* EVM *m; bool init_flg; int *msgbuf */);

#endif /* EVNT_H */

---------------------------- the code ----------------------

#include <gem.h>
#include "evnt.h"

int
Evnt_Multi(m,init_flg,msgbuf)
EVM *m;
bool init_flg;
int *msgbuf;
{
if (init_flg) {
/* never wrote any code where this is not enabled so enable! */
m->evm_event = MU_MESAG;

/* double mouse clicks can be had */
m->evm_clicks = 2;

/* default left button */
m->evm_button = 1;

/* down */
m->evm_bstate = 3;

/* default into */
m->evm_m1io = 0;
m->evm_m1.x = m->evm_m1.y = m->evm_m1.w = m->evm_m1.h = 1;

/* default outof */
m->evm_m2io = 1;
m->evm_m2.x = m->evm_m2.y = m->evm_m2.w = m->evm_m2.h = 1;

/* message buffer, never needed to but may need a larger */
/* one some day which it is not built in */
m->evm_msg = msgbuf;

/* why mess with two ints? */
m->evm_time = 0;
```

```
/* nowt happened */
return 0;
}

/* stupidity check! */
if (m->evm_msg == NULL) {
form_alert(1,"[3][Evnt_Multi()|Not initialised][Fatal]");
return 0;
}

/* the call */
return evnt_multi(
m->evm_event,
m->evm_clicks, m->evm_button, m->evm_bstate,
m->evm_m1io, m->evm_m1, m->evm_m2io, m->evm_m2,
m->evm_msg,
(uint)(m->evm_time & 0xffff), (uint)(m->evm_time >> 16),
&m->evm_mousex, &m->evm_mousey, &m->evm_mbutton,
&m->evm_kstate, &m->evm_keycode,
&m->evm_clicked
)
;
}

---------------------- the example -------------------------

static EVM evm;
static int msg[8];
static uint events;

main()
{
/* mundane "anticrash" initialisation and MU_MESAG enable */
Evnt_Multi(&evm,TRUE,msg);

/* let's say you want the timer as well */
evm.evm_event |= MU_TIMER;
evm.evm_time = 1000;

...

while (!done) {
events = Evnt_Multi(&evm,FALSE);

if (events & MU_MESAG) Hndl_MESAG();
if (events & MU_TIMER) /* etc */
}
}
```

You'll also have to change all the int references to short of course.

Hope it helps :-)

recognizes
>the Fast-RAM. The easiest way to do this, is to create a file called
>AUTOEXEC.BAT (stupid DOS-Name :-( ) in your AUTO-folder, in which you
list
>all the AUTO-folder-PRGS that should be executed after MAGXBOOT.PRG gets
>loaded.
>That's all!!!!
>
>Frank

Ok, I gave it a shot. I get the same results. A famous programmer,
(thanks for the help, I haven't had time to reply, went to
Sac Expo) helped me with an alternative program to FAFA13.Prg to load
MagiC into fast ram. The program works as it should, but MagiC
still does not load into the alternate ram. The pointers and numbers
are there, MagX!boot or MagiC just dosen't use them at the
time MagiC installes itself boot up.
At this point I think that either MagiC or MagX!boot will have to
be patched to "see" the fast ram in a TOS 4.04 system, something that
I am unable to do.

AES 4.1 (with a decent copy of MiNT) was actually not bad. Pity they never
finished it. Very tight in 4Mbs though.

:-)

Roland.

Yes, they are better, but not good. It's just like saying that Win95
is good simply because it's better than Win31! There are several grades
of lousyness.

>> There is another one however called oAESis that you forgot to mention.

: Which, if either, would people suggest is better or do you have a better
: idea?

Depends on preference, mostly. The former would be easier to program,
since it would largely be static, but management after the fact would be
more difficult, since you'd have to keep track of, and add new, variables
as they're added to new versions of the program. The latter would be more
complicated to program, but would be easier to manage once it's done,
since you wouldn't have to concern yourself with adding new variables;
your routine would simply loop until it's done. You could probably keep
your config variables stored in an array of whatever is appropriate. The
main problem I could see with that however, is mixing variable types.
You could have a loop that deals with any type, reading in the parsed
data raw and then sorting it out later in your program, but that would
make it larger and slightly unwieldy when it comes to the routine that
would have to piece together the raw bytes of a char array from your
config array. Any char arrays in your config file would also have to be
terminated in some form so that you could keep track of where, say, that
char array begins, and the next variable, which may be an int, begins.

Personally, I'd go for the first method. The slightly more difficult
management of the variables would be much easier than the extended amount
of code you'd have to write to handle the second method.

2382. Some C questions

Newsgroup: comp.sys.atari.programmer
Date: 1996-03-26 00:00:00 UTC
From: Spencer@mettav.demon.co.uk
Message-ID: <10939_Spencer@mettav.demon.co.uk>
Source record: 9872

I have been wondering about two difficulties I have in C and would appreciate anyones views on them.

The first one involves processing config files. What I want to do is write a config file parser which is as generic as possible. I can see two ways of doing this though one is more generic than the other.

One way I can see is to define variables of suitable types, load my config file, parse it and load the relevant values into their relevant variables. Now this will rely on my having previously setup suitable variables so is pretty much tied to the application. Though this is easiest to setup/use.

The other way would be to malloc a memory area, load and parse the file and then load the setting=value in, possibly using an array of pointers to provide an easy reference to each item.

Which, if either, would people suggest is better or do you have a better idea?

The other regards error handling. Some people have suggested that I write a generic error handling function which is passed various parameters such as the function reporting the error, etc and then display a formatted dialog giving the error condition, trying to recover if its one predefined, writing a log file entry.

This seems good in theory but is possibly open to problems. So does anyone have any suggestions to make regards error handling in C.

Sorry for these stupid questions but as I am only really learning C I would like to get the procedures and approach correct from the start.

Spencer

Hi there you German friend's.

I was wondering if someone of you Atari owners could help me.
The thing is that few years back I was a owner of an Atari ST
computer and owned a EPROM programmer form a German company
called MAXON the name of the programmer is JUNIOR PROMMER.
Now I miss using it desperately because it is an outstanding
programmer for EPROM's and the Atari software was very good.

Now what I want to ask you is do you know if this piece of
hardware could be used with either a DOS/windows machine or a
Apple MAC.

I think at the time this was marketed for few other computer
brands.

Please respond to my Email address if somebody knows or have
solved this problem.

It almost seem worth buying an Atari for this.

With Thanks In Advance:

Gudjon Gudjonsson

Message-ID: <4jb41l$180@tempo.univ-lyon1.fr>
Source record: 9874

Hello,

I use SozobonX C as C compiler. But the problem is that it hasn't got
all VDI functions.

- vst_arbpt (...)
- vst_skew (...)

These functions are used for handling GDOS.
Could someone give me the following informations :

- VDI function numbers for CONTROL
- the parameters for INTIN and ADDRIN
for these two functions

SozobonX C allow people to add new VDI functions
thanks to C_VDI(BP) where BP is an array of pointers on
CONTROL, INTIN, INTOUT, ADDRIN and ADDROUT.

I need these informations coz I want to compile the Enhanced Gem lib
(E_GEM220) for SozobonX.
These two functions are the only one I couldn't translate.

Thanks in advance.

I've downloaded the www_latest.zip file from toad's Archives and
I believe have STiK working correctly. The problem is that CAB won't
display anything. It'll say Resolving, then it stops and up comes a grey
screen with nothing on it. Is this because I have sometihing in CAB not
set up correctly, or is it STiK?
I don't think it's STiK because that will go through the script
fine and say 'Connected' then disappear like it's suppose to. I just
can't seem to get CAB to display anything but grey, and it seems to
actually connect and everything. Any help would be greatly appreciated.

How about malloc-ing a memory area (use an array of structures, or a linked list) and passing a reference (the array pointer or first item pointer) to your generic parsing procedure. The parsing procedure could then run through your configuration file and assign the values. Thinking about it, the easiest method would be to malloc an array and set the last structure in the array to have a string of "", indicating the end of the array.

e.g.

```
typedef struct _config
{
char *setting_name; /*pointer to "setting=" string */
char *setting_value; /*pointer to result, assigned by parsing procedure*/
}config_struct;
```

Finally, you could write a clean-up procedure that frees the setting_value string's memory and then frees the config_struct array after you have finished with it.

I'm sure this idea could be improved upon, but is it any help?

Recheck the NAMESERVER= parameter in STiK. It *must* be set to correctly address the domain name server (DNS) that you Internet Provider specifies. It should look something like 'NAMESERVER = xxx.xxx.xxx.xxx'. Also check that the file DOMAIN.TXT has some lines in it that have these dotted addresses along with some text that matches the URL that you are looking for. Also, check in the comp.sys.atari.st newsgroup for more info.

I forgot to mention, assign the setting_name values before passing it to the parsing function, that was the whole point of my suggestion. Less programming but all the flexibility of you "generic" idea.

Hi folks,

We have a slight problem with part of the WWW117 package. We really need someone to translate the English help files into German so the package is complete.

The important part are the three help files. Ideally three resource files need translating also but this is not essential because the translated help files can explain what the options do.

The translation required is not particularly technical and we estimate it would take between 1 to 3 hours. You will of course get a mention!

Would some kind soul care to volunteer to help us? :-)

How are you compiling it?

32 or 16-bit int?
Stack or register passing?
base-relative or absolute data?

The code can, sometimes, have bugs in it if you take good, "clean" code written for one compiler and re-compile for another. Assumptions about the number of free regs, int size and so forth are the biggies.

I have never had any probs with it under
1) 16-bit, stack, base rel
2) 16-bit, stack, absolute
3) 32-bit, stack, base-rel
4) 32-bit, stack, absolute

Have you altered any options within the project dialog? This was one of my big problems when I upgraded from 5.0 to 5.6 a couple of years ago. The lesson I learned was : Set your compile options from the drop down menu at the top of the screen - NOT from the Project dialog.

[snip - GH's source to sample evnt_multi wrapper]

> You'll also have to change all the int references to short of course.

Not necessary. The Lattice libs can cope. Most (if not all) prototypes in aes.h are defined in terms of "int" - which can be either 16 or 32 bit - rather than a more logical 16-bit to match the underlying system interface. To overcome this, you get a different set of libs for each way you can compile.

> indicating the end of the array.

I guess, I'd prefer a linked list, as it's more flexible. Encapsulating
the list in a pakage would make it easier to use in different appliations.

Inside the package, the (private) specs might look like:

```
struct conf_var {
struct conf_var *next;
char *name;
char *value;
};
struct conf_lst {
struct conf_var *head;
struct conf_var *tail;
};
struct config {
struct config *next;
struct conf_lst *list;
void (*delete)(struct config *);
int (*write)(const struct config *, const char *filename);
int (*read)(const struct config *, const char *filename);
int (*get)(const struct config *, const char *name, const char **value);
int (*set)(const struct config *, const char *name, const char *value);
};
typedef struct config CONFIG;
CONFIG *new_CONFIG(void);
```

The (public) specs as exported in a header might be:

```
struct conf_priv;
struct config {
const struct config *next;
const struct conf_priv *const private;
void (*const delete)(const struct config *);
int (*const write)(const struct config *, const char *filename);
int (*const read)(const struct config *, const char *filename);
int (*const get)(const struct config *, const char *name, const char **value);
```

```
int (*const set)(const struct config *, const char *name, const char *value);
};
typedef struct config CONFIG;
CONFIG *new_CONFIG(void);
```

Regards,
Waldi

d> Personally, I'd go for the first method. The slightly more
d> difficult management of the variables would be much easier than the
d> extended amount of code you'd have to write to handle the second
d> method.
Agreed.

However I want to start writing routines to handle various common tasks which have defined I/O's and can be linked in when needed so my second approach would be better in this circumstance (though not as easy to perform, agree

All entries will have a pointer assigned to first item and be null terminated so dealing with them shouldn't be a problem. Also all pointers will be stored in an array for reference which should make dealing with the actual entries easier.

So the routine will say accept just the path/filename of the config file. Parse it and load the valid variables into the malloc'd block setting pointers and null terminating as it goes. It will then return a pointer to the malloc'd block (plus possibly its size, i'm unsure of making the block size set because of the uncertainty of the amount of variables that may be processed) and a pointer to the array of pointers. The calling program then just obtains the pointers and possibly malloc'd blocks size and goes it merry way using them as needed.

Now I realise this doesn't make actual handling of different types any easier but someone else (thanks Jaap) has suggested using the likes of atoi to convert settings where needed into values other than char.

Allthough definately more complicated than need be such an approach would provide an infintely more generic routine, of much more use for future programs and taking that next step on the road to professionality! ;-)

Even if you do think this is a problem of CAB it normaly is a problem
with STiK and your account.
At the moment STiK only supports SLIP access, no compressed SLIP
(CSLIP) or PPP protocol.
So check out if your provider has set the right protocol for you.

BTW: If your provider does not provide pure SLIP access, stay tuned. I
know that there is done much work to STiK and that there will be a new
release with CSLIP or PPP (maybe both) in it.

Bye,
Michael Guse

Just to let everyone know node 90:90/0 is now back up and operational.

The downtime yesterday was indeed due to the power supply (a capacitor in fact) dying and so no power was getting through to the Mega ST4.

The Mega ST4 is now piggy backed on top of an old DEC Alpha (with no top on) which is supplying the power to the system.

It looks a lot like a derelict spacecraft, but at least we're up and running for mail once more.

Hmmm, this is similar to what I envisioned apart from my routine parses the
file a line at the time without reading it into memory first. It may be a
little slower but disk caching seems to offset that.

d> typedef struct _config
d> {
d> char *setting_name; /*pointer to "setting=" string */
d> char *setting_value; /*pointer to result, assigned by parsing
d> procedure*/
d> }config_struct;
I must admit I hadn't thought of using a struct to store the settings.

d> setting_value string's memory and then frees the config_struct array
d> after you have finished
d> with it.
Yep.

d> I'm sure this idea could be improved upon, but is it any help?
Most certainly especially the idea of using a struct to store the settings, I
hadn't considered that angle.

2403. Some Falcon video and GCC probs ...

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-02 00:00:00 UTC
From: 922746@bud.swin.edu.au
Message-ID: <4jqkm0$97l@lucy.swin.edu.au>
Source record: 9695

```
Hi.

I'm trying to learn to program some video on the Falcon, using
GNU C v2.5.8.

I can detect the monitor, set the video mode, etc.

But I am trying to plot a pixel.

A C function to do this would be real nice.

I have tried doing this with an assembly funtion that Marc Bourlon
(Hi Marc! ;^)) sent me, but have no idea on how to compile it, or
interface it.

Here are the files I have tried.

I know, the code is lame, but you've got to start somewhere ...

"k_falcon.h" is the gcc Falcon binding by Howard Chu,
just tidied up a bit, with the Lattice bindings stripped out.

Thanks for any help in advance,

Karl.

Hi.

Here's another attempt I've made, but I get the following warning.

******
trial1.c: In function `tc_pixel':
trial1.c:56: invalid `asm': operand number out of range
trial1.c: In function `main':
trial1.c:87: warning: value computed is not used
******

This is on the line that reads

******
movew %3,0(a0,a0.l*2)"
******

obviously this is a problem with the way the instruction is structured,
but it's beyond me to make it simpler or acceptable to gcc-as...

Any tips/ideas/hints/code?

Many Thanks,

Karl.

Out of the ether, the following was mentioned by waldi@moacs.indiv.nl.net...:

w> I guess, I'd prefer a linked list, as it's more flexible.
w> Encapsulating the list in a pakage would make it easier to use in
w> different appliations.
Quite complex, but nevertheless interesting.

I'll definately look into using such structures for my config file processing
as it could make life far easier in the long run which is part of the reason
for going for a generic approach.

Spencer

If you want to mix MOT and MIT syntax, you'll need to update
gas, else you'll have to use pure MIT syntax.

(I assume the second a0 should read d0)

2409. A little MIDI program

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-03 00:00:00 UTC
From: thierry@ief-paris-sud.fr
Message-ID: <4ju3ho$grs@upsn6.u-psud.fr>
Source record: 9701

Hello,

Let me introduce you MIDPRDXL.PRG, a strange little program for MIDI synthesizers:
It allows you to play melodies with paradoxical scales on MIDI synthesizers.
You just need an ordinary polyphonic synthesizer (such as a D-5 Rolandus
simplex vulgaris) and an Atari to discover this stunning kind of musical
scale.

What is a paradoxical scale ?

The principle of paradoxical sounds was invented in the early 70s by
Risset and Shepard.

If you play the melody CDEFGABC on a normal synthesizer, the frequency
of the last C will be twice the first C frequency. On a paradoxical
synthesizer, the last C will be the same as the first one !
A paradoxical scale is circular. So, this kind of scale allows you to
play infinitely ascending or descending melodies.

So, when running correctly MIDPRDXL, the lowest C and the highest C of
the keyboard will play the same note, but you will be able to play melodies
"as usual".
Strange, isn't it ?
Here are some explanations...

You will find those explanations on my Web page at:
http://www.ief.u-psud.fr/~thierry

Paradoxically yours,

Thierry Rochebois

2411. STik and CAB problem

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-04 00:00:00 UTC
From: akanthos@beryl.kapatel.gr
Message-ID: <4k023i$28k@lithos.kapatel.gr>
Source record: 9703

I tried to use STik and CAB yesterday. STik dials the number and it says "dial succeed" in the status line and "carrier detected" in the string line. Then it says "find string" in the status line and shows the first string i told it to find in the dial.scr file. These are shown for 40 seconds, then it says "timeout finding" for 4 seconds and the STik window closes. I think it should show the string it tries to find each time and not only the first one for 40 seconds! Is this right?
Anyway, after that, i load CAB and try to open a URL. It says "resolving host", the RD and SD leds of the modem are on and off for a minute or two and then they stop lighting and the "resolving host" message continues to appear even if i wait for hours! Nothing else happens!
My provider offers (C)SLIP and i thought this is the reason i cannot see any web pages on my ST, but the sysop told me that there is an auto detection for (C)SLIP or SLIP demand and there should be no problem. Does this auto detection works only with TCP/IP stacks on PCs?

>right?

Yes, it isn't getting the first line so it's not getting past the
first FIND. What is the *exact* logon sequence required by your
provider? If you don't know, use a standard comms package to find out
what the provider's end wants.

> Anyway, after that, i load CAB and try to open a URL. It says
>"resolving host", the RD and SD leds of the modem are on and off for a

I can't be certain but I would be *very* surprised if this is the
case. TCP is TCP, fortunately even Microsoft can't impose its ever
changing standards on it yet!

Well, I can't imagine you haven't heard from GNU c/c++ yet, but
I'll mention it anyway. There are two other compilers, that I'm
not too familiar with: Sozobon and c68.

You can get the GNU compiler from almost any ftp site.

There is a 1.40 version with moderate memory requirements,
a 2.3.3 version with bugs fixed/features enabled (baserel) that
requires 2MB or more (I have plenty of it) and
2.5.8 and 2.6.3 (has anybody seen 2.7.2 ?) but these seem to be
not as stable as 2.3.3 for me.

2422. How to use MROS?

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-09 00:00:00 UTC
From: kcclaess@cs.ruu.nl
Message-ID: <4kdqns$geg@krant.cs.ruu.nl>
Source record: 9714
Cross-posted to: comp.sys.atari.programmer,comp.music.midi

Hi there,

I am planning to write my owm midi-program on an Atari ST, since Cubase is
too expensive and Happy Music is too constrained.
All the efforts I made were too slow, so I now want to use MROS, the
operating system made by Steinberg. I have a few questions:

1. How do I install MROS? (I already have a version of it)
2. How do I use MROS to play MIDI-notes?

The first question is not that needed, because I can use Happy Music to
install MROS. Can anybody answer these questions, or give me any pointers
to where I can find the answers?

The program I am planning to make becomes public domain, so anyone can
get a copy.

Please if you reply, also send me email.

Regards,
Koen.

PS. Does anybody know of any public-domain good midi-program for the Atari?

2423. Random command in Hisoft Basic

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-09 00:00:00 UTC
From: jpb3@ukc.ac.uk
Message-ID: <4kdlg7$s1j@minerva.ukc.ac.uk>
Source record: 9715

I've been converting a very old ST Basic bridge game to Hisoft Basic, and I finally got it finished. But...I've got a weird problem. Now whenever I run the compiled program I get the same cards. i.e. The random number generator hasn't been seeded properly. This old program uses the RND function, probably a bad command compared to whats available in Hisoft Basic.

Is there any way to get a random seed from the system clock, and should I be using a better command than the RND one that the original ST Basic program used?

Thanks for any help.

John

The example in the MWC Manual on page 326-327 specifically sets the
pointers passed to event_multi() to the existing legal address of a dummy
variable array called 'nowhere[]'.

Sorry to be picky about this.

2426. Using white noise on ST sound chip

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-09 00:00:00 UTC
From: "Mr. Maddog" <mrmaddog@prolog.net>
Message-ID: <Pine.SOL.3.91.960409225533.10054E-100000@ns1.ptd.net>
Source record: 9718

I've read somewhere that the ST sound chip actually has 4 channels
and only 3 are useable for decent sound. The fourth is used for
"white noise" but it may be adjustable. Is this true? And if so,
how may I be able to use this white noise? It's for a game I'm
writting that will use samples(which the 3 channels are tied up for)
and I want something like fly buzz on the 'fourth' channel. I
program in both STOS and 68K assembly right now. Could someone help?
Thanx :)

PS: If I can't do this then how may I use the three sound channels
in STOS?

This is usual for debugging purposes.

>should I be using a better command than the RND one that the original
>ST Basic program used?

Dunno about Hisoft Basic but you can get a random number from the
system Random() function (xbios 17) which returns a 24 bit pseudo
random number. The initial seed is taken from the vertical blanking
frame counter so should be different each time the machine is turned
on. iirc the distribution of bit 0 is poor so you should always
discard it (shift it right one place).

>Anything ever come of this?

Yes, there is an internet project called BAD MOOD that's making it happen.

The Falcon030 is the target machine since its DSP chip and 16 bit graphics
mode are needed to get reasonable speed.
If a lot of DSP code was converted into 68k assembly, something usable
could probably be written for other fast Atari machines as well, though.

The latest version (2.06) can use any DOOM, DOOM II or Heretic WAD with
textures (those are usually several megabytes). Apart from the sky
everything is texture mapped as it should be (including transparent
textures) with light effects. There are no sprites of any kind yet, though.

(Older versions (1.8 or 1.9 IIRC) uses two internal textures and can
therefore be used with any WAD, even those without textures.)

The frame rate on a normal Falcon with VGA monitor in 320x200, with full
texture mapping, is usually around 3-5 fps. The resolution can be changed
on the fly and at 160x100 you could well get 15 fps.
The 16 bit graphics mode makes DOOM/Heretic look quite a bit better than
they do on the PC. :-)

Take a look at my WWW/ftp site (see .sig) for more information and the
program archives.

There is a mailing list you can join if you want to keep up to date.

Can someone give me an explaination of the graphics (not text) modes available on the Atari ST? I'm reading through some file format specs for the Atari ST (NEO, PI, PC, TNY, etc.) and I see mention of low, medium, and high resolutions, but nothing on the size and pixel depth of these resolutions. The standard screenshot size seems to be 320x200, but the Atari FAQ lists 320x192 as a standard graphics resolution. The FAQ also does not explain "overscanned" and "underscanned" modes. I assume this is how Atari achieves 640x200x4 resolution?

Somebody care to enlighten me? Thanks much.

>Somebody care to enlighten me? Thanks much.

The ST has 3 "normal" modes :
- 320*200*16 colors (ST Low)
- 640*200*4 colors (ST Med)
- 640*400*2 colors (monochrome) (ST High)

The Overscan Modes use special techniques to increase the resolution
available. The problem is that there is several different technics
which do that but they are not (all) working on every STs.
In fact there is not a lot of graphics format which use such technics.
There is the .KID format which use overscanned mode in ST Low (I don't
remember the name of the program which manage this kind of file).

Most of the painting program on ST use exclusively the three modes
(like DEGAS ELITE PI1/PC1, PI2/PC2, PI3/PC3)
or only one of them (NEOCHROME .NEO)

Some use special format like SPECTRUM 512 (.SPU, .SPC)
which work in ST-LOW using only 199 lines but 512 Colors in the same
time (using a special technic consisting on changing 3 times the color
palette per line)

I hope I answered your need.

ST-Low: 320x200x16
ST-Med: 640x200x4
ST-Hi : 640x400x2 (Monochrome)

Overscanning is achieved in one of two ways. One is a hardware hack which
removes the borders. The other is through software, which removes the
top, bottom and/or side borders. Removing all four borders is processor
intensive, however, so there aren't many CPU cycles left over for other
things. Overscanning achieves somewhere in the neighbourhood or 360x240
or so, with all four borders removed. It's usually necessary to scrunch
the monitor's horizontal screen size to see a fully overscanned screen.

Hi everybody!

I definitely NEED a tiny program which would, used as an accessory,
force the Atari ST to change the STEP RATE FOR THE FLOPPY DISK b: from
3 ms (default) to 6 ms.
I builded an interface to connect a HD floppy to an ordinary ST with
TOS 1.02 and it works fine, but I have to do this re-setting every time
when I need to work. I do it with FastCopy. But many programs, when
started (e.g Cubase) seem to re-set the whole machine, thus disabling
my little tricks. So it definitely should be an accessory.
Please, help. I believe there's an easy way using Xbios function(s)
from GFA, but I don't have any time to study this better.
This program would, along with the description of this interface,
probably be posted to all newsgroups interested (if any).

>
> "I'm not only an INTJ, I'm smug about it!"James,

Here's some info on Atari ST Graphics Modes

X Y Colors Bit-planes

ST Low 320 200 16 4 32,000 bytes

ST Med 640 200 4 2 32,000 bytes

ST High 640 400 2 1 32,000 bytes

TT Low 320 200 256 8 153,600 bytes

TT Med 640 480 16 4 153,600 bytes

TT High 1280 960 2 1 153,600 bytes

I don't think The ST or the TT use any king of overscan, but I'm not sure.

I have a text file that lists all the known Atari Graphics file formats.

Hope this helps,

Jim Fouch

How much overhead is just removing the top and bottom boarders?

I have a source code for this demo that can do this in 50Hz mode and
I want to put this in a game I'm writting so it'll automatically do
overscan on European machines. I appears that I have to keep
accessing the routine with each vbl. The game is in STOS, but I can
use assembly rountines with no problem. Is there anyone who can tell
me more about it? Thanx

Just in case it wasn't fully clear from the other replies... the Atari ST has only *3* graphics modes:Low, Medium and High, with the pixel resolutions given in the other replies.

The other "modes" are hardware or software hacks to achieve non-standard pseudo-resolutions.

As was mentioned, not all STs can use all of the non-standard resolutions.

For complete compatibility, you have to stick with the standard three.

BobR

The standard ST and STE modes are 320x200 4 planes, 640x200 2 planes,
and 640x400 1 plane. The ST has a 512 colour palette, the STE 4096.

If it's just the hardware modes you are after then that's it, but if
you want to know what resolutions the machine can do then the answer
is any because the OS is resolution independant. Software solutions
either slow the machine down or require you to scroll round a larger
virtual screen. Hardware solutions are obviously the best and depend
on the spec of the card - which are damned expensive because they are
hard to fit - shame really. As you have probably guessed by now,
overscan can be done by software or hardware, or both.

Gem is resolution independant so I assume you mean the software has to
be also be capable of running in one of the three standard modes?
(sorry to be pedantic but I missed the original question). :-)

No I didn't, I've found it (after the replies *again*) ...

He asked about graphics modes in general, not hardware modes, so it
seems best to let him choose if he wants to be bothered with the
information?

You could modify the overscan routine to run itself, rather than run every
time it's accessed. That would produce more stable results, and would
also be easier to use from within STOS. I don't program in STOS so I
don't know what's involved in accessing assembler routines from STOS
programs, but if it's anything like GFA then it should be a doodle.

In the XBIOS function I think, you can not only read the resolution mode number but actually can change it. On the ST, it's 0 for low, 1 for medium, and 2 for high. And I can switch between low and medium resolution for TOS programs, it messes up the GEM display which thinks it's on the old resolution but use a VT52 clear command and it works. This is what I'm going to do with the text file reader I'm written(after my game's done) and what Darek did with QuickView.

But there are the "extra" modes for higher machines like TT, Falcon, and even for Gemulator. If anyone can give me a good idea what these numbers are, that will be helpful. However, the program will switch to either ST Low or ST Med except when it's on those 'true' modes, not the extra ones on the Falcon. And yes, it won't do switching on a high rez monitor.

Utter bullshit. All GEM programs are resolution independent.

Hello, world!

I'm currently writing a command shell, and got a few questions.

First: How does Pexec work? In my header file (I use Alcyon C,
OSBIND.H) says it is Pexec(mode, prog, tail, env), using Gemdos(trap
1) function 0x4B.

Second: How do I surpress CTRL-C? I don't want my program to stop
after pressed CTRL-C, but do other things.

Thanks!

With kind regards,
Bert Greevenbosch.

Yep, Getrez(). It has an inherent problem - it doesn't know about
generic resolutions, like graphics cards or ones you make up yourself.
The VDI will know. You can ask it the width, height and number of
planes etc.

>And I can switch between low and medium

This is fine as long as you do not want to use Gem whilst not in the
"old mode". TOS knows about resolution changes 'cos it's fairly simple
to make the machine do. Gem isn't told because it's too difficult to
expect it and programs running to adapt on the fly. Even multitos
requires applications to terminate I'm told.

>But there are the "extra" modes for higher machines like TT, Falcon,

I'm afraid I don't know the non ST ones but you are right in the
assumption that Getrez() values will change when the resolution does
unlike the VDI.

>1) function 0x4B.

There's a Pexec() cookbook doc out there somewhere. If you track it down can you let me have a copy. In the meantime here's what I know about it ...

mode
----

0 Load and go.
3 Just Load.
4 Just Execute.
5 Create Basepage.

0,3 take the same args ...

prog=executable file.

tail=PC type command tail or NULL.

env=environment string or NULL to inherit current environment.

prog should ideally be fully specified.

tail[0] is the length of the command tail. tail[1 ..] is the actual command tail. iirc, the ARGV extended argument format originally introduced by MWC exists if tail[0]=127.

Mode 0 returns a gemdos error code, mode 3 returns a basepage pointer and all details appear to be filled in correctly as per mode 0 except p_hitpa points to the top of ram and p_parent is NULL.

Mode 4 just takes the basepage pointer returned from Mode 3 and executes - thus Mode 0 is Pexec(3),Pexec(4);

Note that under MagiC you need to use shel_write() in most cases. The only need for Pexec() I have found is for TSR's and for overlays.

>Second: How do I surpress CTRL-C? I don't want my program to stop
>after pressed CTRL-C, but do other things.

etv_term (longword at system memory address 0x408) is the process terminate handler. Default points to an RTS instruction. If you want to regain control install relevent code here.

iirc, MagiC maintains a copy of this for each running process which is dead handy if you plan to hook into the system. So if the user kills the process off then the code here can unhook itself to prevent a system crash.

Mode is most commonly 0, prog is the pathname of the program, tail is
the command line to pass, and env is any environment you want to pass
(generally, an empty string).

>Second: How do I surpress CTRL-C? I don't want my program to stop
>after pressed CTRL-C, but do other things.

Good question. I'd like to know the same thing--especially with
regard to Gemdos trap 9 (text to screen).

From: bhauer@stdntmail.lmu.edu
Message-ID: <4ku4tg$ile@ux1.lmu.edu>
Source record: 9746

Hello:

I am interested in getting a hold of any reference material for programming with STiK. The two programs I wish to develop will be used by my BBS software and therefore would be designed to be run unattended. As such, they need to be able to invoke STiK without user interaction -and- close STiK afterward in order to restore normal modem access. So far as I have seen (I do not yet use STiK since I have a PC at school--I will use STiK during the summer), STiK is an accessory so invoking it unattended -may- require changes in STiK itself.

The two unattended-mode tasks I want to look into are ftp and NNTP clients. I have read the RFCs for these and really just need to know how to open a connection/port, send/receive data through that port, and close the connection via STiK. Just tell me where to dump the bytes and what "exception to throw" and I'll be happy. Of course if there are already available detailed STiK reference docs, that would be nice, too.

Were you refering to XBIOS calls where you read and set the
resolution modes for mainly TOS programs? I only know 0 to 2. The
ST can switch them and use them for the VT52. GEM itself doesn't
even know about the toggle.

My concern is with does the Falcon, TT, or Gemulator have any extra
XBIOS modes other than the three for the ST?

Hi.

I made this posting a while ago, but received 0 replies. So I'm
trying again, hoping that someone will listen this time.

I'm trying to write a function to plot a pixel in 320x200 TC mode.
Got the code, but one instruction the GCC compiler doesn't like.

Can you lot help me fix it!?

Many Thanks, Karl.

Here's another attempt I've made, but I get the following warning.

```
******
trial1.c: In function `tc_pixel':
trial1.c:56: invalid `asm': operand number out of range
trial1.c: In function `main':
trial1.c:87: warning: value computed is not used
******
```

This is on the line that reads

```
******
movew %3,0(a0,a0.l*2)"
******
```

obviously this is a problem with the way the instruction is structured,
but it's beyond me to make it simpler or acceptable to gcc-as...

Any tips/ideas/hints/code?

My code follows.

Many Thanks,

Karl.

Hmm ... I'll just pass on this reflection and let others verify it's sanity ;-)

In C, Ctrl-C won't happen unless you call the OS in some way (printf, gets etc). A possible solution could be to peek into the stdin buffer before doing any OS calls (and then discard the Ctrl-C char if any)

Hmm, after leaving my disk on top of my TV for the past few weeks, I come to do some coding and find everything's gone all funny. My files are not what they once were. My 3d routs have been trashed along with some mfp code, and a load of crap gfx I did. Sorta reminds me of the need to keep a backup from now on... Fortunately, my line-drawing routine is still around. I'd printed it out to have a look at to see if I could see any ways of speeding it up. I finally figured a way out and went to code it and well, lots of rubbish filled my editing window. I'm almost finished re-typing that lot and will post that tomorrow. Currently it's about as fast as I can think of making it - though any help would be appreciated on it. If the rout was just run over and over again without any time left to call it, set up regs, etc. you could draw approx 122 full scanlines per vbl. I figure even with calling code and setting regs up and other rubbish you could still get away with 100 scanlines per vbl. Pretty fast eh?

Anyway, that erasure of my source gives me the opportunity to re-code my full polygon routine. About time too really as well I think. I'm still not sure about the best way of drawing a polygon. I've seen the edge-list fill algorithm and must reject it on the grounds that it'll be far too slow: non-integer numbers required, lots of divisions, etc. seem to make it unsuitable for high-speed, but I'll have another look at it and see about changing it a bit for speed. I should be able to get rid of non-integers by left-shifting everything and then adding/subbing as normal then right-shifting the result back, but I'm still not sure about the rest of the rout - looks slow to me.

The only other way I know of is to calculate the outline, storing the x-coords in a table. ie, a table of 200 long-words, each long representing the start and end co-ord of that scanline. However, this forces me to use convex polygons. For speed though I think convex has to be the way to go.

Anyone got any other suggestions for drawing a polygon (filled)? The table method means that it's easy to clip the polygon, and with some juggling it may be possible to remove the clip routine entirely anyway and bung it in with the polygon drawing rout. I've had some thoughts on this line and like the way things look. But then I thought some more and found that this might not be too good. Anyway, I'll get a simple polygon filler working and worry about clipping the damn thing later. For simple demos where you know the polygon won't be larger than the screen everything's cool.

I don't know the GCC assembler syntax, but I think what you're trying
to do is an acceptable 68030 instruction, but (for sure) isn't valid
68000 code. Perhaps you need to tell GCC it's for a 68030.

Roger

I haven't a clue about GCC or its assembler so please bear with me but
how does a0 get initialized? and what is the relevence of manipulating
d0 and d1 if they are not used?

Also, my assembler would not accept a0.l*2 - it would have to be
something like this ...

```
move.l a0,dn
lsl.l $1,dn
move.w %3,0(a0,dn.l)
```

I've made a texture mapped polygon routine on my Falcon. It draws
approx. 1.3 million pixels/sec (a cube). That is, one 030 instruction
per pixel and 6 DSP instructions. I'm storing the x-outline in a
table and no divisions are required since I'm using a table
with inversed numbers.

: Last time I had access to this newgroup, (long time ago) there was a never
: ending thread running regarding the possibility of a Doom alike on an Atari
: machine.
:
: Anything ever come of this?

Yup!. There are several projects around to port Doom (1 or 2) to the
Falcon or maybe even STe. The best known of these is called Bad Mood. Bad
Mood runs only on the Falcon and the latest version (v2.06?) uses the
original IWAD files that come with Doom 1/2 and Heretic. Currently it is
just a viewer ie..you just run around the 3d world looking at things.
There aren't opening doors but you can walk through the walls, and there
are no enemies or weapons etc...yet!! The graphics look very good, with
Falcon 16-bit colour mode being used to enhance depth shading and so on.
The graphics are in fact far better looking than the original on the PC!!
Soon (we hope) some things like solid walls, opening doors, and life
(other than you) will be used in the coming versions...

Hope this helps...

I did some overscan on my STE five or six years ago, and it was actually very easy to remove the lower border.

The way I did it was to install a HBL-routine that just incremented a counter, it counted scanlines. And when the counter reached 199 (The second last scanline), I changed the HBL-vector to point to a new routine that did the actual overscanning.

It just waited a specific number of NOPs (9?), changed from low to high resolution, then waited 4 or 5 more NOPs before it changed back to low. That was enough to confuse the shifter, and it ignored the DE-signal.

I can't remember how I removed the upper border, but it was a bit more difficult. It also used more CPU-time.

This is called "index scaling", not supported by the 68000 and
68010. The scale factor (0..3) is the number of bits to shift
the index register.

In MOT syntax this is written as "reg[.size][*scale]". If
omitted, scale defaults to 1 (scale factor 0, aka unscaled).

Hello, world.

I need to turn on and off the mouse cursor. I guess I should use the
initmous(type, param, vptr) (XBIOS, trap 14, function 0) function.
Does anybody know how to use this function?

Also, does anybody know where to get reference about GEM, BIOS and
XBIOS functions on the net?

Thanks!

With kind regards,
Bert Greevenbosch.

Does anyone know the value of the WM_ICONIFY variable given in the
Magic 4 hyper text documents.

I understand how to add the Icon gadget to the window title/move bar,
the GEM event message that signifies this item being selected and the GEM
event message recieved when a window is returned to full size. All I need to
know is HOW to iconify the window!

Rarther helpfully the docs gives the following example:-

```
wind_set(wind_handle, WM_ICONIFY, -1, -1, -1, -1)
```

I believe this call both shrinks and expands the window, but what is
the value of WM_ICONIFY!!!!

Thanks in advance for any help.

What sort of program are you writing because this is a very low level call. If it were any lower you would be dealing with the hardware itself!

Gem programs use either the AES or VDI, both have functions to deal with the mouse such as graf_mouse() and various VDI functions. Use either AES functions or VDI. Mixing them can confuse the system unless you are very careful.

Tos programs do not have any mouse functions as such. However, the LineA interface can be used to control it quite effectively.

>Also, does anybody know where to get reference about GEM, BIOS and

There are docs around but offhand, I can't think of anywhere. :-(

> I believe this call both shrinks and expands the window, but what is
>the value of WM_ICONIFY!!!!

(I think that should be WF_... etc. in the wind_set call, not WM_...)

Nope, it just shrinks the window. You use WF_UNICONIFY to bring it back
again.

Anyway, from the MAGX.H header file that comes with the programming docs:

#define WM_ICONIFY 34
#define WM_UNICONIFY 35
#define WM_ALLICONIFY 36

These are sent to you by the window manager (i.e. through evnt_multi()).
You then respond with wind_set() using the values:

#define WF_ICONIFY 26
#define WF_UNICONIFY 27

I believe I obtained the (German) programming documents from
ftp.uni-paderborn.de - look for mgx4doc.lzh

Well, wind_set() does both expand/shrink the window, but you also need WM_UNICONIFY and WM_ALLICONIFY [not sure about the lasts name].

I believe that WM_ICONIFY=25, WM_UNICONIFY=26 and WM_ALLICONIFY=27. I could very well be wrong, so I'm sure someone will correct me. (Try checking the GCC include files - I expect that these constants are defined there...)

The above info is for AES 4.1, but I believe that Magic handles it in the same way...

But Fcntl(fd, FSTAT, &st) is standard, and the library uses it to
implement stat().

Also you can you use the function long Fxattr(int flag, char *name, XATTR
*xattr)

2485. DOC: Scanline filling routine

Newsgroup: comp.sys.atari.programmer

Scanline drawing routine documentation

By G. Jones (email: gjones@cs.man.ac.uk)
22nd April 1996

By the time you read this, you'll probably have already had a peek through the code, so you'll have a better idea of what I'm talking about. You might want to print out the source so you can look at it whilst reading this. (Or the reverse if you're like that). This was meant to be used in a polygon filling routine, but after leaving my disk on top of the tv it got pretty garbaged. Fortunately, I'd got a printout of the scanline routine (I'd been using it to see where I could make any improvements) and so here it is. This is a very fast scanline filling routine, hope you like it.

The routine is designed for ST low-res (320x200) and can draw in any of the sixteen colours. The routine takes in the start and end co-ordinates of a line and fills it in at the scanline chosen. Thus, by having a table of the start and end x co-ordinates for every scanline, a polygon can be drawn. This is the heart of any polygon rendering system. Note that the routine does not cater for lines with holes in them - for speed purposes it was necessary to impose this restriction.

For those who want true speed, sixteen separate routines should be developed, which draw a scanline in one colour only, thus the low-res 16-colour palette is catered for at the best speed possible. A simple left-shift of the colour value will produce the offset for the routine to be used (providing of course that each routine is put on the correct boundary). Though this would result in a better speed, it would result in an excessively long post. Besides, I wanted a working line routine first, before attempting pure speed, so I leave that up to you.

To understand this routine, a knowledge of the ST's low-res screen format is needed. For those who do not have this, here's a quick guide:

The screen is made up in an interleaved format. This will become clearer in a moment. Since we can only use 16 colours, we need 4 bits to store this information, eg 15 is 1111, 0 is 0000, etc. Note that although the palette has 512 colours we can only use 16 of these at once. So, how is each pixel stored? Well, the natural way would be 1 byte = 2 pixels, but that's not what Atari did. The first word (2 bytes) contains the first bit of the first sixteen pixels. The second word contains the second bit of the first sixteen pixels. The third contains the third bit of the first sixteen pixels. And the fourth word contains the fourth bit of the first sixteen pixels. Sounds complicated at first, but you'll get the idea in a minute:

```
0......70......70......70......70......70......70......70......7
\--------------/\--------------/\--------------/\--------------/
1st word 2nd word 3rd word 4th word
plane 1 plane 2 plane 3 plane 4
```

So, if we wanted to make the first pixel colour 16 (%1111 in binary), we'd set bit 0 of plane 1, bit 0 of plane 2, bit 0 of plane 3 and bit 0 of plane 4. Now get the idea?

Ok, that's it for the screen. Understand that and everything's cool.

Right, onto the routine itself.

The idea is simple - to fill part of a scanline in one colour we should realise the following:
That since the line can start from any pixel, most likely it won't be the start of a word, ie the first word we have to do will not be a full word.

Most of the line will be whole words.

The end of the line might not be a whole word too.

Thus, our routine simply draws the first word, fills the bulk of the line, then draws the final word. The trick lies in getting the most speed out of drawing the bulk of the line.

And that's it, but, time to go through the source in detail now that you understand the principle.

First off, into supervisor, save the stack, screen address, put in a new stack, and set up a screen for us to use. Into low-res and display the screen. Now make some tables for the routine to use.

First thing to do is make a lookup table of the addresses of each scanline for our screen. This saves working it out later. Of course, for more speed when drawing a polygon, going from the top of the polygon to the bottom, it would be better to setup the starting scanline address and simply increment that by 160 each time you've called the routine. This'd save a movea.l d(an, ix) each time you call do_line. The table would then only be used at the start of drawing the polygon.

Ok, next we make a mask table. This is for when we draw part of a word. We need to be able to cope with all permutations - ie, from bit 0 to bit 15 to bit 3 to bit 7 all the way to bit 15 to bit 15. This is done by each entry being 32 bytes
long. (An easy multiply factor as well). Thus entry 0 does bit 0 to bit 0, bit 0 to bit 1....bit 0 to bit 15. Which is 2 bytes * 16 = 32 bytes. This is done for each entry. As with almost all assembler programmes, the use of tables helps speed, so long as you've got the memory.

Next, we make a simple table to hold the start and end co-ords of each scanline that makes up a simple polygon - in this case a diamond. This is just one way of storing the information, and a simple one. There are others.

The main loop then sets up the registers, then draws the polygon, and loops until space is pressed, when it restore the screen, user mode and quits.

Now, the line routine itself.

There's lots of comments in the routine so that should help a lot, but I'll include any extras I think appropriate here.

To start with, we get the scanline address from the table, and then must find at which word the line starts from. This is done by anding $fff0 with the start x co-ord. The result then gives the nearest 16-pixel boundary. Of course, for the screen this is divided by 2 since 1 byte=2 pixels.
Then we see whether the line fits in 1 word, if so we can just get the mask, draw it and exit. Otherwise, we draw the first word then draw the rest of the line.

As with other parts of the routine the next bit (do_line_1_word) crops up a few times, with slight changes. The intent is still there though - basically, get the mask, go through colour planes to see whether to set or not that plane and do it.

Again for the first word and then onto drawing the bulk of the line. This is quite well explained in the code so I won't bother here. Again, a familiar lsr-ing of the colour is done to see which planes to set. And then for the last word it's basically do_line_1st_word again.

Note that in the special case of 19 words being drawn we don't need to see if there are any more words to do since there can't be so we exit.

Well, that's about it. Fairly fast, though it can get faster as I've explained here. This'll be my next task, and I can see it speeding up things quite a bit.

Have fun with the code, hope you like it. Again, if you've got any questions, comments, whatever then email me at gjones@cs.man.ac.uk

gaz - 22nd April 1996

```
; Scanline drawing routine
;
; by G. Jones (email: gjones@cs.man.ac.uk)
; 22nd April 1996
;
; This is the fastest scanline drawing routine I can come up with, it's
; easily as fast as many commercial products and on an 8.14 Mhz ST you
; can draw ~122 full scanlines, assuming no time is needed for calling the
; routine or stuff like that. (ie the routine running over and over again,
; with no time for anything else).
;
; If you've got any comments or questions feel free to email me, especially
; if you can make any improvements on its speed!
;
; Set your tab size to 4 or it'll look silly!
;

do_line_words
; This next bit uses a bit of self-modifying code. This is to make the
; routine as fast as possible and is the only way of getting the sort of
; speed I've got out of the scanline drawing routine. Basically, there is
```

```
; a part which moves d4,d5,d6,d7 into (a2)+, ie draws on the screen. d4 is
; plane 1, d5 plane 2, etc. Since we're filling whole words, d4-d7 are
; either going to be $ffff or $0000 depending on whether that bitplane
; requires setting or not. The routine beforehand simply sets up d4-d7 to
; hold the right value. This is really the same as what has gone before,
; but we are setting registers not the screen directly.
;
; There is a little more to it of course - if we did this as it stands the
; routine would always draw 19-word lines (ie 19*16 pixel length lines). So,
; the routine at do_line_words_run (which is what draws the line from d4-d7)
; must be changed somehow so that it ends at the right point and then goes
; onto the final word. This is done by pointing a3 to the address of the
; end of the routine (dlwr_restore) and placing a jmp (a3) at the right
; point in the do_line_words_run routine. This is the code modifying itself
; and the hate of professional programmers. It's nothing special, and
; should be thought of in the same way you set up registers, etc for a
; routine, except in this case we're setting the code up instead. Same
; principle, just got to be a bit more careful.
;
; That would be it, except that we need to restore the code we've changed
; afterwards so it's back to normal for the next run of the routine. This
; is achieved by saving the offset into the do_line_words_run where we
; placed the jmp (a3) and putting a move.w d4,(a2)+ there instead.
; Registers are running short so the stack gets used for once. That's about
; it, just make sure we leave a 2-byte space after the do_line_words_run in
; case 19 words need to be filled (then we'd overwrite dlwr_restore which
; is different to move.w d4,(a2)+) and a check put in to see if 19 words
; have been filled, in which case we need to restore a nop instead of a
; move. (A nop is 2-bytes long).
;
; And that's it. Result? A more complex, longer routine but one which is
; about as fast as it'll get. The first routine I did took ~2200 cycles. I
; re-coded it self-modifyingly to get it to 1300 and then realised how I
; could use the self-modifying bit far more efficiently and got it to this
; speed. Almost three times as fast for worst case in a crucial routine.
; Well worth the effort since this is the core of any polygon routine.
;
; There's probably a few cycles that can be saved here and there, but I
; don't think any major savings can be made. Any saving is worth it though,
; even if it's only a couple of cycles - 100 calls to the routine is then
; say 400 cycles, enough to draw an 80 pixel line, or raster a bit of the
; screen, or do some calculations, or...you get the idea. Remember the big
; picture and don't think oh it's only a few cycles. In this sort of thing
; you need all the cycles you can get!

>Magic 4 hyper text documents.
In PROFILE 2 I use the following code which works under MTOS but not tested
under Magic 4:

#define WM_ICONIFY34
#define WM_UNICONIFY35
#define WM_ALLICONIFY36

When handling your event messages:

short xc, yc, wc, hc;

case WM_ICONIFY:
wind_get(msg[3], WF_CURRXYWH, &xc, &yc, &wc, &hc);
graf_shrinkbox(msg[4], msg[5], msg[6], msg[7], xc, yc, wc, hc);
wind_set(msg[3], WF_ICONIFY, msg[4], msg[5], msg[6], msg[7]);
wptr->iconified = OPEN; /* set a flag to show state of window */
break;
case WM_UNICONIFY:
wind_get(msg[3], WF_CURRXYWH, &xc, &yc, &wc, &hc);
graf_growbox(xc, yc, wc, hc, msg[4], msg[5], msg[6], msg[7]);
wind_set(msg[3], WF_UNICONIFY, msg[4], msg[5], msg[6], msg[7]);
wptr->iconified = CLOSED; /* set a flag to show state of window */
break;

>Does anybody know how to use this function?
One possible way is to use these 2 functions to turn the mouse cursor on and
off. They keep tabs on the cursor state and prevent you making a mistake (ie
turning it off when it's already off etc).

short no_mouse;

void hide_mouse(void) /* universal hide mouse */
{
if (!no_mouse)
{
graf_mouse(M_OFF, 0);
no_mouse = !no_mouse;
}
}

void show_mouse(void) /* universal show mouse */
{
if (no_mouse)
{
graf_mouse(M_ON, 0);
no_mouse = !no_mouse;
}
}

Brian, unless you have some compelling reason to use STiK, I'd
recommend NOS instead for unattended operation on a single-tasking
system. It's capable of exiting after a predetermined idle time, thus
automatically creating a "dynamic" event - and I'm in the process of
writing a complete FIST replacement package. FTP may remain
difficult, however. If you can figure that one out, let me know!

2492. Plotting Pixels in TC Modes ...

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-24 00:00:00 UTC
From: 922746@bud.swin.edu.au
Message-ID: <4lk3ol$c07@lucy.swin.edu.au>
Source record: 9784

Firstly, many thanks to all the helpful ideas people had about my
pixel rout. Unfortunately, I still can't get it to work. ;^(

So I put out the challenge - can someone show me how to plot a pixel
in TC mode?

I'm setting the TC mode via Vsetmode(), so that isn't a problem.

I know how to do this in vga - it's basically (on a poc that is)
you get the offset of the VGA card ($a000), then the 320x200
screen is a linear array after that, and by setting the individual
bytes to a value, you set the corresponding pixel to that color.

Is this similar to the way you do it in TC mode on a Falcon?

And how do you retrieve the base address of the video mode.

I think I'm on the right track...

PLease reply both here and e-mail if possible, as my newsfeed
is about 4 weeks slow...

Many Thanks,

Karl Meyland.

2493. portable way to get resolution?

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-24 00:00:00 UTC
From: eglis@ubaclu.unibas.ch
Message-ID: <1996Apr24.161543.46340@yogi.urz.unibas.ch>
Source record: 9785

Hello, I have a small question.

I'm writing a low-level Graphics Library for the Atari-ST version of
the ETH Oberon System (an Operating System). Since the System should run as
an Application under GEM and on every ST-Hardware that was ever made, I based
it completely on VDI at first. But since VDI is too slow, I want to support
at least the ST-Hi resolution directly by writing to the Display memory.

What I need to know is, what is the most portable way of finding out,
if the machine runs in Hi resolution or not?

It would be possible to check for the width & height & number of colors
of the Display through the VDI. But what if there is a graphics Card out there,
which supports a 640x400 monochrome mode? I just wondered if there is any
safer way to do this?

Also I don't think that XBIOS.Getrez() is of any help, because the XBIOS can't
be aware of graphic cards.

thanx, Simi

Why not rely on what people might already have in their machines to
speed video output - like Warp 9 or NVDI etc? Wayne

2495. MPEG2 44.1kHz Audio Decoder for Falcon!

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-24 00:00:00 UTC
From: noring@lysator.liu.se
Message-ID: <4lm2iu$b02@newsy.ifm.liu.se>
Source record: 9787

I've written an MPEG2 Layer2 Audio decoder for the Falcon.
The program is released under GPL and the current version is 0.4alpha.
Anybody who wants to test it can mail me (noring@lysator.liu.se)
or get it from my homepage (http://www.lysator.liu.se/~noring/DSP.html).

This alpha version of mp2 replays (in realtime) almost every
standard MPEG2 Layer2 44.1kHz Stereo Audio frame (no CRC).

There are two versions of the program. (the Falcon do not support
44.1kHz sound without an (22.5792MHz) external clock)

* mp2e.ttp is the external clock version with high sound quality.
* mp2li.ttp uses linear interpolation for 44.1kHz to 49.17kHz
conversion (no external clock is needed). This reduces sound
quality significantly.

To be done:
* mono
* 32kHz and 48kHz
* more bitrates (only 128kbit/sec and 192kbit/sec are tested,
others might work)
* CRC check

Music can be found at IUMA (the Internet Underground Music Archive)
http://www.iuma.com

Thats exactly what I did up to now. But you need to know that the Oberon
low level Graphics library was of course not designed with the slow VDI in mind.
For example there is no routine to draw a string, only a pattern copy routine,
and every character on the sreen has to be drawn by this routine. So normal
VDI (maybe not NVDI or Warp 9) is just a bit slow for the job on a 8 Mhz ST.
Because I can't expect everyone to have NVDI this doesn't solve the problem.
And also NVDI can never beat directly writing to Display Memory (if one lets
the Blitter aside), because a Trap takes at about 40 cycles or the like
(not including the trap dispatcher).

But anyway, my program would remain perfectly portable on any ST, if I
could properly decide when to use VDI and when not.

Simon

-- English version at the end

Si je me rappelle bien, il existe dans les param�tres du tableau work_out une valeur indiquant si on est sur un �cran couleur ou monochrome (ce doit �tre work_out[13], je crois) - en fait, donnant le nombre de couleurs disponibles (� ne pas confondre avec celle donnant le nombre de couleurs simultan�ment ututilisables). Si on a � la fois work_out[0]=639, work_out[1]=399 et work_out[13?]=1 (monochrome), je pense que l'on peut raisonablement supposer que l'on est en ST haute: une carte graphique �mulant le
mode monochrome devrait donner plut�t work_out[13?]=256 ou 32767... un peu comme le mode 640*400 du TT.

--

IIRC, work_out[13] gives the number of colours in which one can choose the colors on the screen (not to be confused with the number of colours you can use in the same time on the screen, which is given by another work_out - for instance, on ST-low: work_out[13]=512 on STF, 4096 on STE but work_out[??]=16 - may be the contrary); if this number is 1, you're in real monochrome - that is ST high on STE/STF, TT-high on TT. I think a graphic card should give another value, like ST-high on TT (not real monochrom
e but duochrome).

Very very nice!! How about writing an encoder as well? I know
this would free up some space on my HD (lots of samples on it).
I have always wondered if this would be possible on a Falcon,
i guess it is:)

#define WM_ICONIFY 26
#define WM_UNICONIFY 27

These values are the values for iconifying and uniconifying a window.
The rest of the parameters passed are the size of the window to make when
iconifying or uniconifying.

eg.: wind_set (wind_handle,WM_UNICONIFY,x,y,w,h)

x,y,w,h = dimensions of the uniconified window.

Hope this helps.

2501. SozobonX C problem!

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-26 00:00:00 UTC
From: D.G.Williamson@shef.ac.uk
Message-ID: <4lq30a$9hi@bignews.shef.ac.uk>
Source record: 9644

Right, I have a program that I know works on the p.c's and on the st will compile perfectly fine. The problem comes when the object code is being linked using the pml floating point math library.
While it is linking I get the messages as follows.
Double def of _infinity def: in _normdf.o libc.a
Type T, in xerror.o libm.a Type T
undef _raise from xerror.o libm.a

Does anybody have any ideas? If it's of any help I'm using the make utility make.ttp because there are 9 files to link together.

Oh well. If anybody can help me I'd be most greatfull.
Daniel.

Combining the value of the _VDO cookie and the return value of Getrez():

_VDO Getrez
0/1/2 2 => Hi res. 640*480
2 6 => Hi res. 1280*960

> Also I don't think that XBIOS.Getrez() is of any help, because the XBIOS
> can't be aware of graphic cards.

No problem, if you check the _VDO cookie first.

Here are some useful parameters provided by the VDI:

short handle;
static short work_in[11] = {1, 1, 1, 1, 1, 1, 1, 1, 1, 1, 2};
/* v_opnvwk input array */
static short work_out[57]; /* v_opnvwk output array */
static short screen_lines, aspect_ratio, font_ratio;
long screen_width, screen_height;
short planes, colours, palette_size;
short rows, columns, table, backgroundcolours;
static short wchar, hchar, wbox, hbox; /* graf_handle parameters */

handle = (short)graf_handle(&wchar, &hchar, &wbox, &hbox);
/* find VDI handle */
v_opnvwk(work_in, &handle, work_out); /* open workstation */
screen_lines = (work_out[1] + 1) / hchar;
screen_width = (long)work_out[0] + 1;
screen_height = (long)work_out[1] + 1;
aspect_ratio = work_out[4] / work_out[3];
font_ratio = hchar / wchar;
colours = work_out[13];
palette_size = work_out[39];
vq_chcells(handle, &rows, &columns);
vq_extnd(handle, 1, work_out);
backgroundcolours = work_out[1];
planes = work_out[4];
table = work_out[5];

>Also I don't think that XBIOS.Getrez() is of any help, because the XBIOS
>can't be aware of graphic cards.
Do not use GetRez, it isn't compatible and the result doesn't mean anything
on machines with graphic cards, overscan etc.

Source record: 9648

I recently acquired an Atari Portfolio and thought I might write some software
for it. From the Portfolio FAQ I learned that this nifty little palm-top
computer is mostly MS-DOS 2.1 compatible except for some differences in the
serial port address & IRQ mechanism. However, the FAQ doesn't really explain
what exactly those differences are. The only information it gives is a
reference to a $60 book from Atari that I'm sure is long out of print....

Does anyone have a pointer to some Portfolio serial port programming info?
Specifically, I'm interested in what is different about the port itself
and the interrupt mechanism for writing interrupt-driven communication
applications.

Thanks!

Dave

Hi, I started a program in GFA one month ago.
The program is a drawing program, but not like the others.
Actually, it would be a new way to draw with the mouse, I did the first step, just to see if it would be worthy, and I think it is.
The program would be a simple program, just like you draw with a pen.
And the second step of the drawing is the colour. I think the user could use an other program for the colours, because there is a lot of good program for the colour.
I think the important thing in a picture is, in first, the lines, the way they are together, and after you add the colour.
So, in short. I have a very preliminary prg, and I would like , if someone interested, share that, and my ideas about this Prg.
Bye...

2507. FIDO door code ??

Newsgroup: comp.sys.atari.programmer

Would anyone have any starter code for FIDO door BBS games in either GFA Basic or Hi-Soft Basic ???

I run a Ratsoft BBS and am using a USR Courier in Modem Port 2 and currently can not find any BBS games that will recognize that port.

So my solution is to right my own. Or modify current games to use all ports available. I have no clue as to how I could modify the port code so unless I get help..... well ....

Thanks in Advance for any help.

2508. Lattice C object code (bug?)

Newsgroup: comp.sys.atari.programmer
Date: 1996-04-27 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4lt1p0$51d@inca01.inca.co.nz>
Source record: 9651

I have just come across a most unusual bug in the object code that
Lattice C 5.6 produces.

In one of my header files I have a prototype defined as

```
__stdargs uint16 TSRLibInfo( uint16 num, LibInfo *liptr );
```

Where "uint16" means "unsigned integer of 16-bit size", and LibInfo is a
structure defined earlier in the header file. __stdargs tells Lattice to
put all args on the stack, as opposed to registerising the first two.

When calling the function,

```
rv1 = TSRLibInfo( 0, &li1 ); /* li1 is of type "LibInfo" */
rv2 = TSRLibInfo( 6, &li2 ); /* li2 is another "LibInfo" */
```

Lattice C produces the following code:

```
pea li1(a6)
clr.l -(a7)
jsr _TSRLibInfo
move.w d0,rv1(a6)
pea li2(a6)
pea 6.w
jsr _TSRLibInfo
move.w d0,rv2(a6)
lea $10(a7),a7
```

This has clearly increased the size of the first arg "num" from 16 to 32
bits. hence the function call (an assembler interface to an already
resident app) is called with an incorrect pointer to "li1" and "li2".

The correct code should have had a "clr.w" instead of "clr.l", and
"move.w" instead of the "pea"

Casting the first parameter to "uint16" does not help.

The normal compiler opts I use are 32-bit integers, stack passing, '030
code.

The "Long Align Stack" option was not at fault, as I have never used that.

: or get it from my homepage (http://www.lysator.liu.se/~noring/DSP.html).

Sounds good!! I wonder how much bandwidth would be left on the Falcon bus to write a video decoder, to work alongside the audio decoder. MPEG 2 movies with sound here we come!!!... :-)

Surely if you use long ints (ie not the -w flag) then all parameters passed to functions get converted to at least 32 bits before being passed. If you want to pass 16 bit variables don't you have to specify short integers.

Page 196 of the 5.5 Lattice User Manual says
"The compiler generates code to extend each of the parameters to the size of int if it is smaller and then push the parameters on the stack in reverse order."

I rest my case.

>using the pml floating point math library.
>While it is linking I get the messages as follows.
>Double def of _infinity def: in _normdf.o libc.a

It just means that the var (or the function) called infinity has been
defined twice (once in libc, and once in normdf.o)

If you didn't write normdf.o check this two files using HAR3.PRG to
look the defined symbol in them and you'll see if infinity is really
defined twice.

A question :

If you are using pml lib, why do you have libm.a ? in the latest
version of sozobonX, this lib has bin replaced by pml.a
(chek in ftp.fu-berlin.de/programming/sozobon for the latest version
october 1995).
With it you normally didn't need libm.a anymore.

libm was called using -lm in makefile
pml is called using -f .... -lpml in makefile

>Type T, in xerror.o libm.a Type T
>undef _raise from xerror.o libm.a
raise is a function used by xerror.o (which is in libm.a)
I don't know about it. Try to see in which lib this function is
defined.
Maybe it is in libm but before xerror.o !!

The problem is that the linker normally check the libs once when
linking. And if a function is defined before another which use it, the
linker fail to solve its external call.
The solution : force the linker to make multiple pass (check ld
documentation to know how).

Try this:

movew %3,a0@(a0:l:2)

Btw, newer version of GAS can also parse motorola syntax.

a work around is something like this
__stdargs short TSRLibInfo(short,void *);
#pragma inline d0=TSRLibInfo((short),) {;}

int main(void)
{
int rv1,rv2;
long li1,li2;

rv1 = TSRLibInfo(0u,&li1);
rv2 = TSRLibInfo(6u,&li2);
return 0;
}
```

Source record: 9662

hallo leute,

zur abwechslung hier mal eine wirklich saubloede frage:

worin (ausser im cache und den schnelleren div(u,s) und mul(u,s)-befehlen) liegt eigentlich die verbesserung des 68030 (der ja bekanntlich im Falcon 030 zu finden ist) gegenueber dem 68000.

ich hab null unterlagen ueber den 68030 prozessor und hab mir deshalb ein programm geschrieben, dass die taktzyklen pro befehl misst. auf dem 68000 misst es genau die in der literatur angegben werte, woraus ich folgere dass das prg korrekt arbeitet. dumm ist halt nur, dass so ziemlich saemtliche move-befehle mehr taktzyklen auf dem 030 brauchen als auf dem 68000. DAS KANN DOCH WOHL NICHT SEIN. (die anderen hab ich dann gar nicht mehr getestet.)
ein atari st mit 16 mhz wuerde schneller "moven" als ein falcon (ohne cache).
ICH FASSE ES NICHT !!!
ist das jetzt die traurige wahrheit, oder hab ich doch irgendwo mist gebaut.
was gibt's denn ueberhaupt noch fuer neuerungen (gibt's da welche ?)

(falls jemand antwortet) danke im vorraus !!!

Ciao Jens

>i guess it is:)

Encoding is many times more complex than decoding, so I haven't got any
plans for that atm. There's an encoder available (CCETT's ISO compliant
reference implementation) written i C, but it's very slow.
The DSP56k implementation of the decoder is about 30 times faster than
CCETT's implementation on the Falcon, and I wouldn't be surprised if
the encoder can be alot faster too :)

About 16kbit/sec are transferred to the DSP via the host port (depends
on the bitrate used) and about 90% DSP time is used, I guess the CPU
has to do the video decoding :)

Daniel,
I've had a fair bit of trouble using the pml with sozobonX. I get the
impression that it hasn't properly been integrated with the rest of the sozX
stuff.

I think that the library was taken from the GCC version and that some of
the declarations in the routines are different to the ones in the sozX
headers. I got hold of the pml source code and changed the offending
declarations, then ammended the sozX pml.a with the new code (using ar)
and copied the new version to a file called libm.a, which I link in the
usual way.

The definition of infinity - basically a very large number, must be altered
in the header to be consistent with the library routines (or vice versa).
I think the errorno needs hacking too, and as for the actual routines..
my version has real problems with pow()...it requires log() and exp(), and
unless these are called first in the code, they are not linked and pow()
crashes..and even if it does work it fails on ln(10)...
The order in which the library routines are accessed can, I think be
changed using the libsort program? not sure...anyone?

maybe I have an older version of sozX - if anyone has a version with a well-
behaved mathlib, please point me too it!

Andrew.

Not a bug. An ANSI C implementation is permitted to perform the usual conversions (char to int, short to int, etc.) before passing the arguments.

[Article crossposted from comp.programming]
[Author was Steve Guidi]
[Posted on Thu, 2 May 1996 03:58:56 GMT]

Please, please somebody help me with this... I am working on a school project which basically asks a user to enter a mathematical formula and then the program will give the solution to that formula.

For example: if the formula is (R*S)/(R+S) where R and S are predefined values, the comptuer will calculate that using the values and give a solution.

The problem I have encountered is that the USER has to define this formula via an input/output routine. From my knowledge of datatypes, there is no type that will allow the computer to simply use the input as if it were a mathematical formula in the source code itself.

Taking the above formula used, the computer has to realize that R and S are variables in the formula and that the brackets and operateors are operators and not text.

Also, I have to develop this algorithm to use predefined functions such as SIN, SQRT, ABS, LOG, etc..

The formula can take any level of complexity also (there could be hundreds of brackets in there!)

I have consulted with a teacher at my school and he mentioned that the trick must lie with the way spreadsheet programs work. Say I were to enter a formula = A3 * A5 / ABS (SUM E2:E7), the spreadsheet program would work with that forumala with the values in the respective cells. This is VERY similar to what I have to do except I am lost and don't know how to do it!

I plan to use Think Pascal for Macintosh as I am pretty familiar with the software.

Any help on the matter would be greatly appreciated. My deadline is coming up real soon so please email me with some advice ASAP! Thanks for all your help in advance..

Email me ... aq004@torfree.net

PS: I know they teach this stuff in University.. I'm still a highschool student =)

Don't know anything about the way spreadsheets work, but your problem
is easy to solve when you are going to use a recursive function.
Scan from left to right - as soon as an opening bracket pops up,
call your function recursively. I guess that is enough information
for you to solve this tiny little problem.
>

Hallo,
ich habe folgendes Programmierproblem:
Ich will vom DSP im Falcon eine FFT
durchfuehren lassen. Das ist eigentlich
ein Standardproblem, dafuer sollte es also
Loesungen geben, kann mir jemand sagen, wo
ich sowas herbekomme, hat da jemand Tips ?
Genial waere es, wenn da jemand schon eine
Loesung hat und sie mir zur Verfuegung
stellt, aber ein paar Tips sollten es
auch tun.

torsten.mohr@tu-clausthal.de

>if it were a mathematical formula in the source code itself.

No. In a compiled language, any expressions such as that in your source
code are read at compile time and converted into an assembly language
program to evaluate the expression. There is no expression parser in
the output of the compiler, so no simple way to pass a user entered
expression to it. You'll have to do the parsing yourself.

What you need to do is to scan the line looking for terms to add up.
Each term is then passed to a routine that scans through it looking
for terms to multiply or divide, then each term of that is passed to
a routine that scans through it looking for terms to raise to a power.
Each of those terms is then either a number, or a function such as
sin or cos, or an expression in brackets, in which case you pass the
contents of the brackets to the first routine.

It sounds complicated, but it's fairly easy, particularly if you've
got good string functions.

>I have consulted with a teacher at my school and he mentioned that the
>trick must lie with the way spreadsheet programs work. Say I were to
>enter a formula = A3 * A5 / ABS (SUM E2:E7), the spreadsheet program

>This is VERY similar to what I have to do except I am lost and don't know
>how to do it!

Well yes, spreadsheets also have to have an expression evaluator of
course. But the difficult bits about writing a spreadsheet are storing
the data in an efficient way and doing natural order evaluation, neither
of which do you have to worry about.

Was *genau* hast Du da getestet? Wie *genau* hast Du die Zyklen gemessen?

Ich nehme an, dass Du den 68030 in einem Falcon getestet hast. Bedenke bitte,
dass im Falcon mehr Zyklen fuer Video abgehen als bei einem einfachen ST.

Generell hat der 68030 eine riesige Menge von Verbesserungen gegenueber einem
einfachen 68000:

- Beschleunigungen bei einigen Befehlen
- Neue Befehle
- eingebaute MMU (sehr wichtig!)
- eingebauter kleiner Cache
- kann hoeher getaktet werden
- ...

Hello,

Is there somebody on this news group that attempted to generate sounds with the DSP ?

As a basic program, I would like to implement a sine wave generator as described in Motorola's Application notes:

http://www2.motorola-dsp.com/dsp/engineering/tech_doc/app_note.html
(Acrobat Format).

And even easier if you use LEX and YACC (or better, the more modern FLEX and BISON) to do the lexical analysis and parsing. Setting up a simple expression interpreter using these tools is very easy. The YACC manual even used to come with a little example that did just that.

You could always write the function out to a text file, wrapped in a suitable
function declaration like:

```
double userExpression()
{
return <insert_user_function_here>;
}
```

Then all you have to do is run the compiler, dynamically link the object file
your executable, and call the function. It might be tricky to get the variables
passed in correctly, though. They may need to be globals.

;-)

I've not implemented the sine wave generator, but some
DSP sound effects programs and an MPEG2 Audio decoder.
(I've got a simple DVS sample replayer written in C and DSP56k
assembler on my home page: http://www.lysator.liu.se/~noring/DSP.html)
Hope this helps.

Here's how I'd deal with the problem:
(rough solution!)

function EVAL_EXPR return FLOAT is
RESULT: FLOAT;
OPERATOR: CHARACTER;
begin
RESULT := EVAL_TERM;
while CURRENT_INPUT_CHAR='+' or CURRENT_INPUT_CHAR='-' loop
OPERATOR := CURRENT_INPUT_CHAR;
GET_NEXT_INPUT_CHAR;
```

```
if OPERATOR='+' then
RESULT := RESULT + EVAL_TERM;
else -- OPERATOR='-'
RESULT := RESULT - EVAL_TERM;
end if;
end loop;
return RESULT;
end EVAL_EXPR;

function EVAL_TERM return FLOAT is
RESULT: FLOAT;
OPERATOR: CHARACTER;
begin
RESULT := EVAL_FACTOR;
while CURRENT_INPUT_CHAR='*' or CURRENT_INPUT_CHAR='/' loop
OPERATOR := CURRENT_INPUT_CHAR;
GET_NEXT_INPUT_CHAR;
if OPERATOR='*' then
RESULT := RESULT * EVAL_FACTOR;
else -- OPERATOR='/'
RESULT := RESULT / EVAL_FACTOR;
end if;
end loop;
return RESULT;
end EVAL_TERM;

function EVAL_FACTOR return FLOAT is
begin
case CURRENT_INPUT_CHAR is
when 'A'..'Z' =>
RESULT := VALUE_OF (CURRENT_INPUT_CHAR);
-- adapt this one if variable names are more than 1 char long
GET_NEXT_INPUT_CHAR;
return RESULT;
when '(' =>
GET_NEXT_INPUT_CHAR;
RESULT := EVAL_EXPR;
if CURRENT_INPUT_CHAR /= ')' then
raise SYNTAX_ERROR;
else
GET_NEXT_INPUT_CHAR;
return RESULT;
end if;
when others =>
raise SYNTAX_ERROR;
end case;
end EVAL_FACTOR;

-- all the construction launched as above:
```

```
GET_NEXT_INPUT_CHAR; -- actually the 1st char of the expression
FINAL := EVAL_EXPR;

-- depending on how you get the input chars,
-- you'll see how to deal with the last expression char.

Good luck.
```

2543. NOW AVAILABLE - Enhanced Joystick Ports FAQ

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-03 00:00:00 UTC
From: mbge4mdc@meehpa.ee.man.ac.uk
Message-ID: <4mclhl$q54@yama.mcc.ac.uk>
Source record: 9686

After many hours of research, soldering, re-learning C and tapping in test code, then realising it was getting too damned close to my exams for me to finish this, my Enhanced Joystick Ports FAQ is now available from my web pages.

I would urge anyone who is programming for the Falcon/STe (especially, but not exclusively games programmers) to grab a copy of this. Just use the URL in my .sig and click on anything looking vaguely like an Atari link (HINT - It's got a Fuji logo, and the word ATARI on it).

It would probably also be of interest to owners of STes, Falcons and Jags (for the latter, it even icludes plans for a Tempest 2000 compatible rotary controller!). Please pass it on to other owners, too - there are some minor restrictions to this, but they are just to stop anyone making lots of money out of my research and not giving me any!

Cheers,

Xav

Read a computer science book, but don't expect us to do your homework
for you. Find a good book on recursive parsing-- the source code for that
sort of thing is a page of code at most.

That's an interesting idea.. but a bit clumsy to start the compiler just =

for that. Or else you could write it as a scriptfile(batchfile) like =

this:
eval <userinputstring>
then you could simply execute this file, and then use the returned value =

as the aswer. Note that <eval> is the Amiga command for this kind of =

operation, replace this with whatever appropriate for your system. Could =

be a problem with a Mac though.. it must be possible in some way.

The question may be, the answer is definately not trivial!

>Recently I found out that GEMDOS.MAlloc(-1) does not return the free
>amount of memory but rather the largest free Block. Am I correct?

You are.

>And if so, how can I find out the amount of free memory?

It depends on what you mean? I'll assume you want to add up all the
free blocks - but remember they are separate. There is no way *your*
program can (reasonably) join them together to make a larger block.

The most portable way to do this is to use only the tools you are
guaranteed to be provided with - Malloc() and Free(). Something along
the lines of ...

```
/*
blkptr = some array of longs
blkheadsiz = size used by header
*/

n = 0
total = 0
blksize = Malloc(-1L)
WHILE (blksize NOT ZERO)
blkptr[n] = Malloc(blksize - blkheadsiz)
n = n + 1
total = total + blksize
blksize = Malloc(-1L)
ENDWHILE

WHILE (n NOT ZERO)
SUBTRACT 1 FROM n GIVING n /* aggh cobol! (n = n - 1) */
Mfree(blkptr[n])
ENDWHILE

PRINT total
```

This solution begs the question of how big the blkptr[] array should
be and how to obtain the value of blkheadsiz. For a generic solution
blkptr[] must be obtained dynamically which complicates things. For

portability across operating systems, you can make no assumptions
about the size of blkheadsiz so this must be calculated also.

Under a multitasking operating system the above code would have to be
run in supervisor mode to block task switching ...

```
ENTER SUPERVISOR MODE
total = TOTAL_MEMORY() /* ie the something like the above code */
LEAVE SUPERVISOR MODE
```

The OS can now task switch again. It leaves our process (A) and hands
control over to process B. Process B then Malloc()'s (or Mfree()'s)
some memory. Another task switch back to A ...

All we've achieved is to find how much free memory there was at the
time we checked - pretty useless except to provide a real time display
of memory. There is *no* other purpose for doing it.
If we can guarantee the code will run on known systems then it would
be a trivial matter to follow the OS free memory chain adding up the
sizes of the blocks.

The only way to obtain extra space whilst a program is running is to
try and Malloc() it and provide code to recover if the allocation
fails but note the following pitfall when attempting to allocate the
largest block ...

```
char*
biggest_block()
{long n =Malloc(-1L);
char *p =Malloc(n);

return p;
}

/*
* WRONG
* possible task switch between Malloc(-1L) and Malloc(n) above
*/

main()
{char *p =biggest_block();
}

/*
* CORRECT
* task switcher blocked.
*/

main()
{char *p =Supexec(biggest_block);
}
```

2549. Help/Ideas wanted to DM type of game

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-05 00:00:00 UTC
From: miqco@sci.fi
Message-ID: <318cc25c3dddb05@sci.fi>
Source record: 9691

Hi !

I'm programming, as a hobby, game engine which
is Captive/DM type, 3D perspective rpg (NOT DOOM like).
I'm programming it with GFA Basic 3.5E and Falcon. I might
change to HBASIC if I start using non ST screen modes
or If I want to compile it, because I have not get my GFA-
compiler(3.5) work correctly in my Falcon.
My mouse routine works now as it should, with
pageflipping too. Also I have done routine to check all
visible 3d parts of screen to be seen (and drawn too).

My problem is memory taken by pictures.
I have drawn picture for each possible walls/floors/roofs
in 3d vision. There is only 2 type of texturetypes to these
but they allready take 3 NEO screens.

Is it better to draw only one wallpicture (ex. 160X100)
for each types and calculate all others from that ?
Is it better to use packed pictureformats (which)?

I've thinked about changing resolution to
640X400 16C/256C RGB or 640X480 16C/256C VGA, because it looks
much better that way. So I have to change the format of
pictures too. Maybe its GIF type if I can get some info
of that format and learn how to act with it.

Any comments are welcome !

Miquel

2550. help with tc-pixel stuff

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-06 00:00:00 UTC
From: 922746@bud.swin.edu.au
Message-ID: <4mjuur$946@lucy.swin.edu.au>
Source record: 9543

Hi Everyone, it's me again. ;^)

After all the messing about with the different assembler syntaxes, I decided to go back to good ol' C to do the work, and then mess about with optimisations later.

Now, I think I nearly have it all down hat, except I'm unsure of how I should use the (void *) returned by Physbase(), and I'm not sure that I'm POKEing the color into the memory correctly with my PutPixel() rout.

If someone could modify this so that it works, and/or explain what I'm doing wrong, I'd be most appreciative.

Replies here appreciated, and e-mail really appreciated!

Also, if anyone's got some C routs for the Joystick / Joypad, I'd be most appreciative.

Many Thanks,

Karl.

P.S. Crap code follows.

>Recently I found out that GEMDOS.MAlloc(-1) does not return the free amount
>of memory but rather the largest free Block. Am I correct?
Yes.

>And if so, how can I find out the amount of free memory?
Do a series of Malloc(-1) until there is no memory left. The routines below
get largest available blocks of ST RAM, TT RAM as well as total memory:

```
unsigned long free_STmem, lblockST, lblockTT, free_TTmem;

free_STmem = GetFreeSTMem(); /* get free ST memory using Malloc(-1) */
free_TTmem = (rom_ver >= 0x200) ? GetFreeTTMem() : 0;
/* get free TT memory using Mxalloc(-1) */

unsigned long GetFreeSTMem(void) /* calculate free ST TPA memory */
{
char *p[20];
long *mem = NULL;
char x = 0;
short first = 0;

free_STmem = lblockST = 0;
if (rom_ver >= 0x200) /* ROM version >= TOS 2.00 */
{
do /* make sure that get ST RAM only */
{
if (mem = Mxalloc(-1L, 0)); /* return largest block */
{
p[x++] = Mxalloc((size_t)mem, 0); /* Mxalloc it out of the way */
free_STmem += (unsigned long)mem; /* add to total and do again */
if (first == 0)
{
lblockST = free_STmem; /* largest free block global */
first = 1;
}
}
} while (mem != NULL); /* until no more blocks left */
}
else
{
do /* get ST RAM if Mxalloc not available */
{
if (mem = Malloc(-1)); /* return largest block */
{
p[x++] = Malloc((size_t)mem); /* Malloc it out of the way */
free_STmem += (unsigned long)mem; /* add to total and do again */
```

```
if (first == 0)
{
lblockST = free_STmem; /* largest free block global */
first = 1;
}
}
} while (mem != NULL); /* until no more blocks left */
}

while (x != 0) /* free the memory blocks */
{
Mfree(p[--x]);
};
return (free_STmem); /* return total */
}

unsigned long GetFreeTTMem(void) /* calculate free TT TPA memory */
{
char *p[20];
long *mem = NULL;
char x = 0;
short first = 0;

free_TTmem = lblockTT = 0;
mem = Mxalloc(16, 1); /* TT RAM is available? */
if (mem == NULL)
{
altram_avail = 0;
return (free_TTmem); /* return total which = 0 */
}
else
{
altram_avail = 1;
Mfree(mem);
mem = NULL;
do
{
if (mem = Mxalloc(-1L, 1)); /* return largest block */
{
p[x++] = Mxalloc((size_t)mem, 1); /* Malloc it out of the way */
free_TTmem += (unsigned long)mem; /* add to total and do again */
if (first == 0)
{
lblockTT = free_TTmem; /* largest free block global */
first = 1;
}
}
} while (mem != NULL); /* until no more blocks left */

while (x != 0) /* free the memory blocks */
{
```

```
Mfree(p[--x]);
};
}
return (free_TTmem); /* return total */
}
```

Having written several programs like this, about all I can say, Nathan, is
your pages are too long. :)

One good book on parsing and recursive descent expression evaluation is
"Algorithms + Data Structures = Programs," Niklaus Wirth. It has two
advantages for you: It's probably in your local university library, and
it's written in Pascal. Since your using Pascal, that could help a lot!

main()
{char *p =Physbase(), /* ie any 32 bit declaration */
*l =Logbase();

printf("Physical screen starts at 6\n",p);
printf("Logical screen starts at 6\n",l);
}
```

The whys and wherefors of writing directly to screen memory are best
decided by you but I would have thought you would be better off
writing to the logical screen. By default, it points to the physical
screen anyway but would make future enhancements easier?

It does also occur on a user-mode read, IIRC.

>I'm asking these questions as i don't have an ST with me at the moment.

Yea, guessed so....

I'm writting an ST emulator and have a few questions on the 68000.

Does anybody know what LEA (An),An do ?? is it the same as MOVE.l An,An?
I know that LEA d16(An),An just copies the address An+d16 into An..

Also does ADD.W Dn,An etc. effect the top 16bits in An..?

Also, does a bus error occur when you only write to the first 2k of
memory, or does it also occure when you read there too in user mode.

I'm asking these questions as i don't have an ST with me at the moment.

Thanks.

Hullo Again ;^)

Can anyone tell me how to turn the mouse cursor on/off? I seem to remember
a long time ago that it involved messing about with a variable
at $4004 or something like that?

C code would be nice, or a pointer to a gnu header ...

Many thanks,

Karl.

I think so, but maybe the effect on the conditions codes is different.

>
> Also does ADD.W Dn,An etc. effect the top 16bits in An..?

adda.w / suba.w do sign extensions on the source operand.

>

I've tested this recently on my ST (only reading).
Reading from the first 2k is invalid.

hello,

I'm just a beginner, and tried to program in Lattice C. Simple C
programs that do not use GEM are no problem, but programming a window,
or connecting a rsc-file to a program written in C is something else.
Can somebody help me with this?

Greetings Saka

Yes, both are nop's, without any change to the condition codes.

|> Also does ADD.W Dn,An etc. effect the top 16bits in An..?

Yes, the lower 16 bits of Dn are sign-extended to 32 bits before
adding them to the 32 bits of An. But LEA (An,Dn.w),An is faster.

|> Also, does a bus error occur when you only write to the first 2k of

Both reading and writing.

Andreas.

I think that it is the same as MOVE, as far as the result is concerned.

:
: Also does ADD.W Dn,An etc. effect the top 16bits in An..?
'An' is always treated as a 32bit value when written to. So in your example,
ADD will add a 16bit Dn value to a 32bit An value.

:
: Also, does a bus error occur when you only write to the first 2k of
: memory, or does it also occure when you read there too in user mode.

When you read or write.

:
: I'm asking these questions as i don't have an ST with me at the moment.

The STOS users' magazine desperately requires contributions in the shape of articles, letters, messages, suggestions, programs, etc. in order to survive. The editor, Deano, has informed me that he has very few articles for the next issue of STOSSER, let alone the long term future of the long running disczine.

Any contribution will be warmly received and DOES NOT NEED to be STOS-related. Any Atari article is welcome. Note, there is no payment made, the magazine is non-profitmaking and is avilable as PD. Your views and news, contributions and source code, etc can be sent to me:

sinbad@airtime.co.uk

and I will pass them on to an eager Deano. Come on, put something back into the Atari scene!

Thanks in advance for any contribution made.

To find out more about STOSSER check the WWW page at:

http://www.airtime.co.uk/users/stosser/

or visit my homepage at

http://www.airtime.co.uk/users/sinbad/

Any access to "supervisor" space whilst in "user" mode is trapped by
the MMU. Supervisor space also exists over the i/o area (offhand -
$ff8800 up?).

I dunno what you mean by "portable", since Malloc and Free you usually
don't use for portability but rather malloc and free (lower case).
In application programs thats usually better anyway, because each Malloc
takes up a snippet of GEMDOS poolmemory, which AFAIK is pretty limited
(you extend it with FOLDR100.PRG) at least in older TOS versions.
And its really portable.
There is no malloc(-1L) or somesuch to discover how much free memory is
available on the other hand.

: All we've achieved is to find how much free memory there was at the

Portable in the sense they are documented system calls as opposed to
hacking into the system.

>In application programs thats usually better anyway, because each Malloc
>takes up a snippet of GEMDOS poolmemory, which AFAIK is pretty limited
>(you extend it with FOLDR100.PRG) at least in older TOS versions.

The MWC arena grabs something like 16Kb blocks and doles it out itself
to offset the TOS memory bug. Like you imply, this makes Malloc(-1L)
effectively useless as well.

>And its really portable.
>There is no malloc(-1L) or somesuch to discover how much free memory is
>available on the other hand.

It wouldn't be possible to provide a standard malloc(-1) because that
would imply the operating system is capable of "locking" the memory
management system between the n=malloc(-1) and malloc(n) calls. If the
OS could not do this then it would render the malloc(-1) useless in
the same way as Malloc(-1L) nearly is for user purposes.

>: All we've achieved is to find how much free memory there was at the
>: time we checked - pretty useless except to provide a real time display
>: of memory. There is *no* other purpose for doing it.

>Hmm, thats a strong statement I wouldn't put my name under.

I think I went a little over the top there, yes. In fact I have written a MagiC program which uses Malloc(-1L) for the sole purposes of grabbing all *but* a specified amount of memory. I use it in parallel with test programs to ensure they do not fail when memory is suddenly in short supply or non existent.

"d16" gets sign extended to 32 bits, and then added to An.

> Also does ADD.W Dn,An etc. effect the top 16bits in An..?

The value in Dn is sign extended from 16- to 32-bits, and then added to
the 32-bits of An.

> Also, does a bus error occur when you only write to the first 2k of

Both reads and writes are affected. But this is controlled by thr Atari
MMU chip, not the "in CPU" MMU in '030+ processrs

: NVDI but not if run before or without NVDI. Any ideas?

:-) I have written one of these as well - damned usefull when your machine boots up in bloody low res on a VGA monitor...

I have mine working fully - it's about 3rd in my AUTO folder (a program to turn the speaker off, then FPATCH or something like that before it). It definitely works without NVDI coz I haven't got NVDI.

You say you are passing the pointers to the logical and physical screens? I don't think you want to do that - just pass -1.L for those and let the OS sort it all out (it will reallocate the screen to be the correct size for the resolution you want and reinitialise the VDI).

I'll fish out my source code later on, so if you have any more problems, just let me know.

Cheers,

You should be able to find some source code examples around. Sometimes people include the source code with their PD offerings, otherwise there are a few books that show how to use Gem more or less properly.

But chopping and changing someone elses code is a reasonable way to start.

I based the design of my font editor Fonty on the examples in Compute!'s ST Application Guide Programming in C, which is full of errors and ommissions, including being aimed at a compiler called Alycon C that I have never come across, but gave me a framework to build a proper fully functioning desirable program with. The breaking the different Gem tasks into different modules made the whole design of the program easy to maintain and adapt.

Tim Oren's Gem Class is available on most ST PD libraries and is not too bad.

I have that version of GFA-Basic (3.6 TT) and one thing you do _not_ want to do is set the fast load bit to on. The interpreter does not like that. I also had problems with it when ExtenDOS was loaded and that is easily solved by not booting up the ExtenDOS. Newer versions of ExtenDOS may not cause this.

Hope this helps...

Isn't that a little ... permanent? I just want to write a little auto folder program that can set the screen resolution properly prior to running (for instance) a shell program. the default resolution with a VGA monitor isn't suitable.

Hmmm. In my experience, windows are the easy part of GEM programming and dialogs come next. Programming a simple frame to handle window events will teach you the basics of event-based programming, then adding a menu looks like the next step, as this already involves creating a RSC file. Designing a menu with an RCS is quite simple, dialogs is a step further IMHO.

In any case, get `Profesional GEM' by Tim Oren. It's a public domain TeX book about GEM programming, and though a bit outdated by the advent of modern callback libraries and new options in the newer AESes, it's still a good start.

>How do you do that?

There are a number of little programs that allow you to set your NV-Ram.
eg. Bootconf (I think this is the one that I used...)

ftp://ftp.cnam.fr/pub/Atari/Falcon/Utilities/btcnf120.zip

You can say whether you want double-line on/off, number of columns, and
the number of colours, of the initial resolution.

Dont touch the HD stuff, unless you know what you are doing...

Not for 2 bombs, but sometimes (with v 3.5) it crashes - writes whatever he wants but not what i say - with long programs & many unused variables. May be the same thing?
I'm not using it for long programs since that, and i've no more problems (on a Falcon30)
Hope it helps,

hehe, we're proabably going to end up having to agree to differ on
this one 'cos your reason for starting with windows is my reason for
not doing so, namely events! :-)

Anything asynchronous is a nightmare to debug. Couple this with the
modern trend of putting dialogues into windows (and thus a form_do()
replacement) then a thorough understanding of the object tree is a
must.

Very true.

2585. GCC questions...

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-14 00:00:00 UTC
From: jacquesa@cs.man.ac.uk
Message-ID: <4n9ou3$8gj@m1.cs.man.ac.uk>
Source record: 9578

Hi, I'm trying to write a fairly large program in GCC, and could do
with some answers to these questions... My GCC version is 2.6.? IIRC
and runs under MiNT/MultiTOS on my 4mb Falcon.

1) is it possible with GCC to have part of the code using an FPU
(on TT/Falcon), while another part uses software emulation?
2) How do you use inline assembler?
I have a short (20/30 lines) assembler routine which I want to
use, but cannot get it to use it.
3) Has anyone compiled EGEM for GCC?

Cheers

Anthony

Yes on 3, but I have not tested it fully.
Used an STFM (4 Mbyte) & GCC 2.5.8

2587. Help w/ BC-FORTRAN77

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-15 00:00:00 UTC
From: rob@nbnet.nb.ca
Message-ID: <832212538_OASIS_@nbnet.nb.ca>
Source record: 9580

Hi,

I'm trying to do some FORTRAN programming and find that source that happily compiles on WATFOR causes all sorts of syntax error reports when I try and compile it using BC-FORTRAN77. Things like "IMPLICIT NONE" don't seem to be recognized and generate an error. Maybe I'm missing something in the setup of BC-FORTRAN but I can't imagine what?

Does anyone have any experience successfully using BC-FORTRAN compiler 1.3c by Andre Kostli. Does it use a different standard than WATFOR or have some differences in syntax? Does anyone know of another FORTRAN for the ATARI, pd or commercial that might work better.

I'm not slamming BC-FOR at all and really appreciate the efforts of all involved in its' distribution but I'm really currious as to why I'm having problems compiling stuff on it, which don't occur with WATCOM.

Any help on this would be appreciated.

Thank's
Rob

2588. evnt_multi to get left & right button clicks- How?

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-15 00:00:00 UTC
From: mbecroft@tos.ak.planet.gen.nz
Message-ID: <GEPUFAUSUp@tos.ak.planet.gen.nz>
Source record: 9581

I have been trying, with no luck, to use evnt_multi for getting clicks
from either the left or the right button.

I want evnt_multi to return when the user clicks the left button, or when
the user clicks the right button, or when the user clicks both buttons.

I followed the method described in the compendium, but this did not seem
to work. Also, the compendium does not explain what value to pass
for state, it merely says that you must OR a value of 0x100 with the mask
parameter, making the mask parameter 0x103.

I tried a number of values for state, including 0x01, 0x02, 0x03 and all
of the above ORed with 0x100. These all worked in different ways, but
none of them had the desired effect. It would either respond to only the
left button, or only the right button, or in some cases none at all!

I am interested to hear from anyone who has got this working - explain
what you did.

I am using AES 4 with MiNT 1.12.

Thanks for any suggestions.

What the 0x100 means is to negate the state requirement.

If you are waiting for either key, you are waiting for the state to
be anything other than zero, so it's 0x00 you want.

The explanation in the compendium was dreadfully unclear, even worse than
the Genie posting by someone in atari developer support that I assume it
was based on.

There is a solution quite simple.

replace event_multi(MU..., x, x, x,....)
by event_multi(MU...,130, 3, 0,....)

- add 128 to ev_mbclicks
- set ev_mbmask to 3
- set ev_mbstate to 0

Then, you'll have an event for right clic OR left clic.
(check ev_mmbutton).

This method works with all tos versions exept 1.0.
It was originaly a bug, which has not been corrected to allow people
to keep on using it. It also works with Magic.

Prospero software will still flog you Prospero FORTRAN for GEM. You
won't get much by way of support though. Still, it comes with two huge manuals
on the A.E.S. and V.D.I. It took me through two physics degrees, analysed CERN
data, plotted solition waves, the lot. It only complained once when I tried to
do something really disgusting with EQUIVALANCE statements. Whad'ya wanna be
messing round with IMPLICIT NONE for anyway ? Seriously, I gave some PC-owning
"friends" a copy of BC-FOR, and so long as they kept it simple, they were able
to compile some simple numerical examples. Oh, the one thing PROFOR dosen't have
is a resource compiler. Bring a copy of WERCS. (Or better...)

Anyway, you can reach Prospero at:

Prospero Software,
190 castelnau,
London,
SW13 9DH,
England.

Well I'be been through most of Tim's tutorial and it is a good starting point. But where do you get the info on the modern callback libraries and the new AES stuff? BTW I have been using eXtended Sozobon C, if this makes a difference.

I could never have worked that out by reading the compendium!

So, I pass 0x103 for mask and 0 for state, I will try this out.

Also, does this work on all AES versions or only newer ones? If so, how new?

Thanks very much!

Well, I tried both methods suggested, and none of them worked!

However, I did get it working in the end, by using 0x102 , 0x03 , 0x00
for clicks, mask and state.

Thanks to everyone who replied.

No, I couldn't remember which one you had to add 0x100 to so I deliberately
didn't say :) Phillipe said correctly that it's the number of clicks you
need to add it to.

I made a TERRIBLE mistake when I wrote that las year.
it is not 128+number of waited clicks but 256+waited clicks.
It's when I looked at my routs at home that I find the problem and I
couldn't answer you before.

I beg your pardon for this.

Hi, I have a Copy of Tom Hudson's Cad3D.v2 for the Atari
but my copy of hardcopy.prg produces defective Gem files
- the files seem to be truncated, and the metafile extents are
not updated.

The original disk does not boot correctly, and all by backups
have the same problem, so the problem may have existed when
I got the original disk. At the time I used the printer driver,
but now I need Gem files so as I can covnvert to Postscript.

Do you have a version of hardcopy.prg, hardcopy.rsc that uou can
uuencode and send me ? I know this is commercial software, but
harcopy is useless if you don't already have Cad3D.

Hi

I'm currently writing a large GEM based program. One of the things
that I need to do is detect the user clicking and dragging an object.
The object is just a few lines (drawn with the VDI). How do I detect
this with evnt_multi()? I need to be able to distinguish a single
click from a click/drag ...

Oh, I'm writing in C on a Falcon (MultiTOS compatable)...

Cheers

You might like to use/adapt the following for evnt_multi(). Nothing
special but it makes it less prone to silly crashes and gives it some
reasonable defaults if you fail to set it up.

typedef struct {
int evm_event; /* required events */
int evm_clicks; /* required number of clicks (usually 1) */
int evm_button; /* required button (1==left,2==right) */
int evm_bstate; /* required state (0==up,1==down) */
int evm_m1io; /* 0 == into, 1 == outof, (default into) */
Rect evm_m1; /* default, all set to 1 */
int evm_m2io; /* default outof */
Rect evm_m2; /* default, all set to 1 */
int *evm_msg;
ulong evm_time;
int evm_mousex;
int evm_mousey;
int evm_mbutton;
int evm_kstate;
int evm_keycode;
int evm_clicked;
} EVM;

int
Evnt_Multi(m,init_flg,msgbuf)
EVM *m;
bool init_flg;
int *msgbuf;
{
if (init_flg) {
m->evm_event = MU_MESAG;
```

```
m->evm_clicks = 2;
m->evm_button = 1;
m->evm_bstate = 3;
m->evm_m1io = 0;
m->evm_m1.x = m->evm_m1.y = m->evm_m1.w = m->evm_m1.h = 1;
m->evm_m2io = 1;
m->evm_m2.x = m->evm_m2.y = m->evm_m2.w = m->evm_m2.h = 1;
m->evm_msg = msgbuf;
m->evm_time = 0;

return 0;
}

if (m->evm_msg == NULL) {
form_alert(1,"[3][Evnt_Multi()|Not initialised][Fatal]");
return 0;
}

return evnt_multi(
m->evm_event,
m->evm_clicks, m->evm_button, m->evm_bstate,
m->evm_m1io, m->evm_m1, m->evm_m2io, m->evm_m2,
m->evm_msg,
(uint)(m->evm_time & 0xffff), (uint)(m->evm_time >> 16),
&m->evm_mousex, &m->evm_mousey, &m->evm_mbutton,
&m->evm_kstate, &m->evm_keycode,
&m->evm_clicked
)
;
}

to use simply ...

EVM evm;
int mas[8];

main()
{
/* initialise */
Evnt_Multi(&evm,TRUE,msg);

/* main loop */
for (;;) {
events = Evnt_Multi(&evm,FALSE);
if (events & MU_...) blah.
}
}

In your case you need to be looking for button events so mask in
MU_BUTTON events (evm.evm_event |= MU_BUTTON) - the rest of the
defaults set above will do the job as they are (and do double clicks -
change evm.evm_clicks to 1 if you dont want these). When you get the
MU_BUTTON event, evm.evm_mousex and evm.evm_mousey will contain the
```

mouse position when the event occurred, and evm.evm_mbutton holds the button state at that time. evm.evm_kstate is also valid in case you want to make use of shift etc.

At this point you obviously need to ascertain if the mouse was within your "object" and act accordingly. Assuming it is ...

If you were displaying an OBJECT tree things would be a little easier because you could use graf_dragbox(). You could of course generate a dummy OBJECT then call graf_dragbox(). Note that this and other similar aes routines terminate immediately if the left mouse button is not down when they are called.

You may want to drag the object in such a way as the object itself moves rather than having an outline. Try graf_mkstate() which tracks the mouse in real time and blit the object accordingly. As soon as your routine via graf_mkstate() detects the mouse button is up then the object should be dropped.

That's about it without some specifics! :-)

2607. Question about minix

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-23 00:00:00 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-2305961007260001@47.85.0.99>
Source record: 9600

Hi

Does anybody know why copying folders from one minix partition to another (using 'CP') works differently when the commands are typed individually as opposed to using them in a batch file?

I recently had to copy several folders from one disk to another. I wanted to select the folders to be copied (about 35) from a disk with 90 folders total.

Because the desktop has problems with long filenames, I was resigned to typing CP -dvR (source) (dest) for each folder.

I tried to save time by creating a list of wanted folders & edited this to make a batch file with all of the filenames & parameters. This appeared to run ok, but after it was finished, none of the folders were present on the destination disk.

The destination disk was also full of errors (I used fsck).

When I 'CP'ed all the folders (typed in the names) everything was ok.

Is this a problem with mintshel or is it some problem with Minix.

Maybe the minix daemon was prevented from running by the amount af data being transfered (approx 90 Mbytes).

Also, I use Tapebios (magnetic tape driver) with Gtar (special version of tar which works with Tapebios) to backup files. Using Tapebios, I can do image backups or TAR backups with no problems on TOS partitions (up to 250 Mbyte no problem so far).

I can do image backups on Minix partitions also, but for some reason Gtar crashes when I try to tar more than 50-70 mbytes from a Minix partition.

I have an idea that MiNT is causing the crash, I am using freeMiNT 112.5. It also crashed under older MiNT versions.

Anybody seen this before.

I think MagiC docs can be obtained from one of the german ftp sites
though I don't know where. The Compendium would be a good source for
modern documentation - it is also available on cdrom now as well.

I believe Pacman was invented by the japanese company Namco first for
the arcades and later licensed by Atari for the VCS console.
So you will have to ask Namco about it... they should be on the web
somewhere.

Bye,

haven't written draggable-item code in yonks, but here is a sample
algorithm that should work:

```
Call event_multi
if event is a click (MU_BUTTON)
if button is still down (vq_mouse)
change mouse to "drag" shape (graf_mouse)
wait for mouse button to be released (vq_mouse)
do appropriate "item has been dragged" processing
show "on-screen item has been dragged"
change mouse back to arrow (graf_mouse)
end if
end if
rest of processing ...
```

2615. RE: pacman copyright

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-24 00:00:00 UTC
From: Evan Samuel <esamuel@iamerica.net>
Message-ID: <01bb4945.9536fac0$4cfdadcd@esamuel.iamerica.net>
Source record: 9608

Pacman was first introduced by ATARI corporations game division.
Warner Brothers owned Atari at that time, and still owns the Atari
game division and all rights to the Pacman game.

The original game was the coin arcade machine (around 1979). Later,
Atari's computer
division sold the home version (around 1982). This was before the sale to
of
Atari computer division to Jack Trameil, who was CEO of Commodore
computers.

Hope this helps
Evan

^^^^^^^^^^^
Is it really a good idea to mix AES & VDI calls like this? You could use graf_mkstate(), or even another evnt_multi() (with a short timer) instead...

> change mouse to "drag" shape (graf_mouse)
> wait for mouse button to be released (vq_mouse)
^^^^^^^^^^^
See above...

> do appropriate "item has been dragged" processing
> show "on-screen item has been dragged"
> change mouse back to arrow (graf_mouse)

> end if
> rest of processing ...

Also, a wind_update() would also be a good idea.

>
...
>
>Do you have a version of hardcopy.prg, hardcopy.rsc that uou can
...

Thanks for the offers of Hardcopy; I now have one that works better than
mine, though it still does not write in the Metafile extents.

When I put these in by hand, Timeworks publisher V2 is happy with the Gem files
and I can produce postscript from Timeworks - small thing print fine
large things take forever to print, though Ghostscript is quite quick
to produce images, even on the ST.

mfps still won't accept the Gem files - it starts to produce a
postscript file from the Gem, then crashes.

So, my next question is " does any one know the file formats for :

Cad3D.v2 .3d2 files,
Cad3d.v2 .SIF (sequential image) files
GEM header (first 20 or so integers)

In the Gem header I have deduced that integers [5,6,7,8]
(counting from 1) are the Metafile lower,upper limits.

For the output of Hardcopy I set (16 bit integers)[7,8] to be 20479 32767.
(or in bytes : [13 to 16] set to be 255 79 255 127).

This nicely fills the box in Timeworks when loading the image.

Thanks for the (4) offers,

cheers
beau webber

Just check if the button is still down after evnt_multi returns.
If it is, then you know the user is still holding the button down, and
therefore dragging.

2619. GEM Libraries for the PC

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-25 00:00:00 UTC
From: grimus@cix.compulink.co.uk
Message-ID: <DryB8q.ECz@cix.compulink.co.uk>
Source record: 9612

After 9 years ownership of an ST at last I am trying to write a GEM application in C. Now all this effort would make more sense if I could convert GEM applications I write to the PC. But I have been unable to find ANY mention of GEM in any of the PC archives I have searched.

What I am looking for is a PD GEM library for the PC. Can anyone help please, I would be willing to buy a commercial version if someone has one for sale.

It's a pity Digital Research did so little with GEM, it had the main features of Windows without the 'bloat'. Windows 95 has just got the grow-boxes and folders of GEM some 10 years late. How did DR manage not to make a success of it ? :-(

Thanks
Mike

Hi,

I am trying yo get in touch with Olaf Meisiek the author of the
excellent resource editor Interface.

I am using the Mydials resource extension routines in OASIS 2 and can't
use the 3D options because the GFA Basic version of the Mydials software was
compiled in such a way that I can't send the 3D on/off flag when Mydials is
initialised.

If yopu are reading this Olaf, or someone knows how I can get in
contact with him PLEASE e-mail me.

Thanks in advance.

I'm not sure about on-line documentation, but you might like to consider the book "The Atari Compendium". It's about 40 pounds sterling available from HiSoft (and loads of otherp laces I'm sure). It's very complete, covering MiNT, MultiTOS, etc all the way up to TOS 5 (although I haven't found any system calls etc that are TOS 5 only...)

I'd shy away from the evnt library funcs, as they can cause a task switch
to occur. But in my experience, the time it takes from evnt_multi
returning, through to the above vq_mouse call is generally long enough so
that if the user has moved the mouse, or released the button, it'd be
apparent from the vq_mouse call.

To get the system VDI handle, one could call graf_handle early on, and use
it with vq_mouse and so forth.

If one needs to alter any system VDI attributes, one can always use
vq_extnd, change the attrib using vs?_xxxx, then do whatever, and restore
using vs?_xxxx.

> Also, a wind_update() would also be a good idea.

True. Most of my code has been dialogs in windows and so forth, so the windowing library I wrote aeons ago has been used - it already did wind_update and mouse positioning code etc. It's not bulletproof (nothing is, despite what the marketeers say), but it works, and I haven't had a "it killed my data" support call yet that could be traced to it.

(In my library, each window got a separate VDI handle of it's own as well, so I used that in the above algorithm).

Hi Peeps :)

Does anyone have any information regarding java, rather then send me to a web page, can anyone give me a quick easy to follow rundown on what it actualy is, and any realtive atari software?

Is html authoring classed as programming?

There are html newsgroups, but making html pasges for an ATARI browser is a little different :), would this be the place to discuss it? that's presuming we feel it comes under "programming" ???

Cheers.....!ynoT

JAVA is a programming language that feels a bit like C.
It is primarily used for writing scripts into HTML code, but compilers
for it are appearing on the PC...

As yet, I do not know of any compilers available for the atari, or any
atari-browser that supports JAVA code.

All one can assume is that "TOS 5" is essentially MultiTOS with AES 4.1.
Nothing newer than AES 4.1 seems to appear in the book.

I haven't seen any refs in the 1000-odd page Compendium (April 1994 ed.)
to TOS 5.0 explicitly

> Tnx in advance,
> Christian

This sounds a lot like a job you have to do for school. I'll hint
you. This is ANSI C-code for a shift+add multiplication:

```
int mul(int x, int y)
{
int i, res; /* Reserve two variables */

res = 0; /* Temporary result */
for (i=0; i<8; i++) { /* Loop 8 times */
if (x & 128) /* Is bit 7 set? */
res = res + y; /* Yep, add */
res = res << 1; /* Shift left (multiply by 2) */
x = x << 1; /* Shift left */
}

return res; /* Here we have the result */
}
```

What remains is to convert this to assembly, and if you know anything
about that, it should be easy.

If you want the routine because you need a fast multiply, I can only
recommend doing a tablebased implementation. Some base themselves on
the fact that log(a*b)=log(a)+log(b), while others split the operands
into chunks of say 4 bits to reduce the size of the table.

Greets,

Asger Alstrup

The latter functions are _very_ machine dependent so it would be wise to group them into modules. For each machine you want to support, you need a new implementation of the module. The header file, however, should be the same for all machine dependent modules.

I programmed a graphics device interface (GDI) some years ago, which was solely responsible for the screen memory access. Thus toggling pixels on and off, querying pixels, etc., was managed by the machine-dependent GDI, while the drawing stuff (Bresenham lines/circles, Beziers) was left to machine-independent modules.

I'll have a look into my dusted disk boxes and see if I can recover the stuff for you.

> I have termcap and curses docs, but I must admit it looks a bit strange
> for me!

Termcap and curses are OK for character-oriented I/O; from the above I gather that you want to program pixel-based applications.

2639. Problem with SpeedoGDOS

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-29 00:00:00 UTC
From: prajoux@chnou.laas.fr
Message-ID: <4oi1pq$8h6@laas.laas.fr>
Source record: 9632

I have just acquired and installed SpeedoGDOS 5.0c and I am trying to write a few small programs using it.
I am in trouble outputting to my Epson Stylus 820, for which I use a Speedo driver that Epson France is providing. The problem is as follows:
- I open correctly a printer workstation (returned parameters are OK).
- I load the fonts.
- I obtain the correct index 5043 for the font American Garamond (for example).
- Then, vst_font() refuses to select this font, returning a value of 32760.
- Of course no text output can be obtained after that.

Can anybody help me trace the problem? Thanks.

Roland Prajoux

PS: the same program works perfectly when outputting to the screen.

2640. Re: Cad3D - gem2ps converter

Newsgroup: comp.sys.atari.programmer
Date: 1996-05-29 00:00:00 UTC
From: J.B.W.Webber@ukc.ac.uk
Message-ID: <1555@kiwi.ukc.ac.uk>
Source record: 9633
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

If any one is interested, I have written a program to generate
postscript from the Gem files produced by hardcopy.prg for Cad3D
sequential image files.

You see the problem was that hardcopy produces shading by defining
a new fill pattern for each polygon - Ghostscript previews this
no problem - just a few minutes on the ST even for a 40KByte Gem file,
but an Apple Laserwriter was spending hours to produce a picture.

I have written a short Apl program that reads the Gem file and produces
a postscript file that uses greyscale half toning (it just counts the
dots in the fill pattern). The same picture prints in 30 seconds.

If you have an interest in the program, I will translate it to C.

cheers,
beau webber

Does the PS mean that you're getting the proper value (the font index
5043) from the vst_font call in the case of a screen workstation ? That
almost certainly points the finger on the printer driver, as the
vst_call is redirected by GDOS directly to the printer driver. Maybe the
driver provides some not by Atari or DR specified error code, or perhaps
it`s just buggy. Try a different font as well, maybe the printer driver
looks for some specific stuff in the font the screen driver is not
interested in. If it's the same for all fonts blame EPSON. Since they're
eager to provide a printer driver for Ataris (which is rather astonishing
for the computer world nowadays) they might even allow you to speak to
the people who developed the driver.

Cheers Peter

As has already been said, Java is a programming language intended for making programs that can run on any web page. The Java Developer Kit can be obtained free of charge from Sun Microsystems, but it does currently only exist for Windows NT/95, MAC and Solaris.

I don't think anybody is working on a porting to the ST. There is also no web browser for the Atari that supports Java applets.

OK, I'll take a shot at this.....

You can think of lightweight processes as 'subprocesses'. Imagine
that you implement your own threads package, each thread will then
be a lightweight process inside the common OS process assigned to the
package.

Hope this helps.

/HUGO.

>You can think of lightweight processes as 'subprocesses'. Imagine
>that you implement your own threads package, each thread will then
>be a lightweight process inside the common OS process assigned to the
>package.

>Hope this helps.

>/HUGO.

Imagine the following analogon:

A lightweight process (or a thread) is to a process
as o process is to the computer

within processes, multiple *threads* of control can exists (hence the name)
they share the same adress space and the same recources. The can comincate
to each other using this shared adress space and mutexes and condition variables.
(Look at some document for Inter Process Communication for more information
about these things).

You can implement a user thread package, or have kernel support for
threads (Like Solaris).

When programming such packages you see typical calls like:

thread_create(procedure_name, variables, stack_size, &tid);

thread_destroy(tid);

thread_yield();

The last one is to voluntarily give op the CPU (used in non-preemted
thread packages).

Hope this helps.

Hello,

I am currently writing an editor for my JX8P synthesizer
and I want it all neat 'n clean with GEM.
I looked at the seceral RCS editors available but none
of them supported sliders... Are there some extensions
that I could use, or do I have to progrm my own sliders,
any experiences with this?

Thanks in advance,

Florentijn van Kampen

I'm afraid that you will probably have to program your own,
sliders are not a base Gem object but are built from several
objects (buttons, draggable items, etc). Maybe there is a
custom software library out there that helps with this?

Hi,

Sliders are related to AES windows. Ressources, and thus ressource editors, are related to AES object trees.
If your program is using windows with sliders, this has nothing to do with any ressource that this same program may use. Windows, with their sliders if any, deals with the interaction between the user and the program. So, of course, you (i.e. your program) must manage the sliders yourself, using appropriate AES calls.

Cheers.

Hello everybody,

I'm a quite isolated french developper working on a program
called Eureka 2.12. It's a 2D numerical analysys program, and
a 3D object modelling of mathematical shapes. It include
also 4D presentation, because a time parameter is available.
I'm in degugging phasis, so I would need experienced people
to tell me oppropriate comments on strengths and weaks of
my production. If anyone of yous, wood be so kind as to
play the role of awared critic on my work, it would be
a great help for me ...
I must precise, that my work is in french for the moment.
If anyone has ideas about it's translation it would be
great ... Anyway mathematical langage *is* international.
My program is available by FTP on the "Conservatoire
National des Arts et Metiers" at :
ftp://ftp.cnam.fr/pub/Atari
or on my home page at :
http://www.ief.u-psud.fr/~lecoat/
Anyway the last release is on my home page ...

Thanks for your help ... Bye for now !

Well... well, JAVA is not in any way depending on X11. It is developed
only by sun soft. Other companies have paied them for being able do make
java compilers for comercial stuff. One can also download th Java
Developer Kit Scouces for free, if you sign a declaration by sun. I
hered (ie. not at all sure) someone was going to port it to MinT. I
don`t know what happened to that. I think, that as soon as it is
available CAB won't be long to suport it.

If you are not using using AES windows then you will have to build
your own sliders completely from scratch either low level via the VDI
or using G_BOX's suitably organised. Some of the graf_???() functions
could help you here.

It is a little simpler with AES windows, mask in H_SLIDE, V_SLIDE into
wind_create() as appropriate. and use wind_set() to position and size
them. When you interact with sliders then the AES sends you a message.

Note a proper calculation is a little more subtle than would first be
apparent. This is how to calculate the slider position - you will need
to rearrange the formula to calculate "window_start" from the new
position from the AES message you received.

position = 1000 * window_start / (total_length - length_seen)

window_start = position displayed at the beginning of a
window - ie if line 40 of a doc were at the
top of the window then this would be 39 (start
at zero).

total_length = doc length in lines - maybe 2000 lines for
example.

length_seen = how many lines currently fit in a window.

If you were processing an image then the above would be in rasters perhaps. That is, the formula is based on units of the same logical entity. It does not matter what that entity is, as long as the values are supplied in units thereof.

A 200 line doc with 20 lines visible in a window currently displaying line 40 would result in 1000 * 39 / (200 - 20) = 216 which is not quite the 200 which you would initially expect.

Now issue wind_set(,WF_V/H_SLIDE,position,)
^^^
whichever

The slider size (the white bit) is supposed to represent the percentage of the total doc which is currently visible ...

size = 1000 * (length_seen / total_length).

Note that where the document is smaller than the window then values will start going out of the range 0..1000 and some extra processing will be required.

Also bear in mind not to let overflow occur in the calculations.

> do appropriate "item has been dragged" processing
> show "on-screen item has been dragged"
> change mouse back to arrow (graf_mouse)
> end if
> end if
>rest of processing ...

Call event_multi..
if event is a mouse button pressed (down) and
mouse over a draggable object then
event_multi(mouse_up | timer = 100ms)
if event is timed out then
change mouse shape
loop
event_multi(box | timer = 100ms | mouse_up)
if event = timedout and old_mouse_pos != new_mouse_pos then
redraw outline shape endif
if event = box then
undraw shape endif
if event = mouse_up then
exit endif
end loop
endif
endif

note.. box is a little box a couple of pixels either side of the mouse..
if the mouse leaves this then it's time to move the shape... the timer
delay means you don't waste time redrawing or blitting a shape when the
mouse is moving quickly... the event_multi calls means other AES stuff
can go on in the background.. as well as task switching and so on...

Just my tuppence worth..

Neil

What is the best and most safe way to find the Bits/Plane for the resolution you are running in.

Is is Int{L~A}, or is this not safe anymore.

Should I use Work_Out(13), does this work on true color graphics cards and the Falcon030.

Also, will Work_out(0) and Work_Out(1) always return the X & Y for the screen, even on graphics cards.

Any help would be Great!!

Thanks,

This can be stated very clearly : It's the best way to use VDI, and it's
not safe to use any Line-A. Line-A doesn't exist on most graphics cards.
But the documented VDI behaviour should work on every ST style computer.
The Work_out return values you mentioned are of course documented and can
therefore be used safely on every machine.

Cheers Peter

You should use ONLY AES/VDI functions for the best result, no LineA.
Yes, Work_Out(13) should works on all graphics cards and Work_Out(0)
and Work_Out(1) for X and Y screen resolution.

Java was originally developed by Sun as a language for reliably programming consumer devices. It is based on C++ but has automatic garbage collection and no pointers to increase the robustness and reliability of programs.

Java programs are compiled into bytecode. Bytecode is not native code to any particular machine architecture, rather it is native to a Virtual Machine (VM). In order to run a java program you need a VM for your (real) machine.

Sun realised that java could be adapted to distribute software over the internet. You would only need to compile a java program once and it would run on ANY machine that had a VM written for it. Hence the VM was first incorporated into Web browsers as a means of easily extending their capabilities. At present the java VM is only incorporated into two Web browsers - Netscape 2 and Hotjava.

As I understand it the VM can only be ported to 32bit systems. So if it were ported over to TOS based machines it would be limited to Falcons, TTs, Medusas, Pak030 etc.

In theory it is brilliant, because any program you write in java has a market of all the machines with a java VM. In practice the VM has only been ported to Intel, Unix and Mac machines. It is currently slow and buggy in my experience, but will undoubtedly improve with the introduction of things like just-in-time-compilers that compile bytecode into native machine code on the fly.

Sun wants java to be an open system, so language specifications and source code are freely available. I don't know about the source code to write the java compiler or VM though. In theory, if the VM could be ported to a 32bit TOS machine we would have access to a wealth of software.

> Is html authoring classed as programming?

No. I don't want to get into a theoretical discussion on what consitutes a programming language, but I would suggest a true programming language needs logical and mathematical functions and control over data and execution flow. Html possesses non of these.

Hope this helps,

Michael

Well, Sun is working on a java chip. It is supposed to run Byte code
directly.

> As I understand it the VM can only be ported to 32bit systems. So if
> it were ported over to TOS based machines it would be limited to
> Falcons, TTs, Medusas, Pak030 etc.

Oh! The 68k is a 32 Bit processor. Guess, why sinclair once sold their
68008 Machine as a 32 bit Computer (with multiplexed 8 bit Data Bus).
the 68000 has a multiplexed 16 Bit Bus. That was one of Ataris,
Comodores and Apples Marketing Mistakes. they did not beat ther real 16
bit Machines by IBM with greater numbers. Just look at DEC, SUN, or SGI.
They now are proud of presenting 64bit Machines. so they are supposed to
make realy fast Computers. Just whatch a Alpha with byte operations. It
is really slow!!

on the other side Java does nor reqire a 32 bit machine. The Virtual
Machine is 32 bit. that doesn't say anything about the machine it is
implemented on. Theoretically a 1 bit machine would be enough (though
not sensible).

> Sun wants java to be an open system, so language specifications and

The sources of the JDK (Java Developer Kit) are freely available. You
just have to sign, that you don't distribute it in any way, because
Javasoft wants to have Control over it. As long as you don't make money
with it, Javasoft doesn't take any from you.

Christof

2667. Music/graphics program

Newsgroup: comp.sys.atari.programmer
Date: 1996-06-07 00:00:00 UTC
From: Keefy <fkeith@cs.strath.ac.uk>
Message-ID: <31B7F45D.167E@cs.strath.ac.uk>
Source record: 9510
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Has anyone written a program, similar to that on the Sony Playstation
music/graphics thingy? I know it would not have the 3D effects etc,
but anything is better than nothing.

I once wrote a STOS program which strobed the screen with the music,
reading from my Stereo Master sampler, but, as it was STOS, it was
not very good. Ideally, I would like something that only reacted to
the bass of the music.

I would have liked to write the STOS program in assembler, but I know
sod all about the ST's screen addresses and how to clear the screen etc,
although I can use assembler but don't have one for my STE.

Please e-mail any replys as I am on my Uni vacation just now and don't
have much time for checking Usenet (it's a Uni account), and I will
miss any postings (probably).

Thanks in advance,

Fraser.

Even I'm not going to disagree with you here. Awful as STOS is for most
of the purposes people put it to, I have to say this is one application
where STOS is ideal. Apart from the crap editor that is.

Then your intentions and your postings don't seem to be on the same
line, to say "as it was stos, it was not very good" is a criticism of
the programming language, your intentions may have been different, but
what I read, is what I saw, is what I responded to :)

STOS can be criticised for many things, it is not the greatest of
languages by any means, but if someone wants to say such, then they
should have tried it to its limits then said its not up to it,

>Also, it's not that I "could not do it", I did! I just wanted it to be

I do not, and never gave the impresion I could, my point and whole
posting was based on your sweeping statement re stos,

>is the the subject of degrees and is (probably) not easy, and STOS as an
>interpreter would probably not be any good (unless there is an extension
>for this).

c'mon! thats exactly what you implied, you may not it would now seem
have meant that, but I doubt anyone reading it would have read it any
different?,

>can be very powerful when utilised fully, but all I want is a simple,
>fast as possible program. Assembly seems the best choice for this.
>

>And what happened to a little courtesy? Most browsers have a button
>to send as mail and news, so is it too much to ask that you press
>that one instead?
>
I did, I sent the posting as mail and news, I could not see any
reason not to include the posting in the newsgroup, it is a harmless
debate after all ?

You have missed the point of my posting,

1) hopefully the smileys and the lack of any animosoty or swearing
or nastyness or anything showed that this wasent exactly meant as a
personal attack, hence the public posting :)

But let me explain why I responded?

2) I use STOS (you guessed that already?), and I find there is very
little it cannot do, I am the keeper of the FAQ and have written
various articles on the subject for everything from diskmags to
national magazines (with the use of a spell checker),

For many good reasons, people have an instant opinion of STOS and
believe it to be totally useless, this is brought upon in no small
part by people telling everyone it's ....useless, Your posting DID
make it look like you where blaming stos, you havent the extensions,
upgrades or even the compiler it now seems, to have enough experience
or knowledge to make this claim, sorry to labour the point, but you
cannot simply say "as it was stos it was not very good", you are
helping get the language a bad name by making such unfounded
statements,

After all, what is "comp.sys.atari.programmer" for, if not to debate
such point's?

Cheers.............!ynoT

> Just because you could not do it, that does not mean that STOS was
> not capable,

I wasn't criticising STOS as such. I don't have the compiler, so the
load up time was about 2 minutes for a program that would probably take
30 lines of assembeler, and no matter how good STOS may be, assembly
will always be faster than an interpreter based language (unless you
have the compiler, which would have to be very efficient).

Also, it's not that I "could not do it", I did! I just wanted it to be
better, and as I don't know much about good ways to convert an audio
signal to a moving patern etc, I thought I would ask to see if anyone had
done something similar. Do YOU know how to do it? Real time sound analysis
is the the subject of degrees and is (probably) not easy, and STOS as an
interpreter would probably not be any good (unless there is an extension
for this).

> >I would have liked to write the STOS program in assembler, but I know

I meant clear the screen using assembly language. I thought that was
obvious in the question.

> >although I can use assembler but don't have one for my STE.
> >
> You have an STe...for crying out loud!, STOS is exactly what you
> want, DMA? no problemo, even more commands if you have a Falcon

What use is DMA in this application? Please tell me so I can use it.
I don't even think I have the extensions anyway. (looking at the last
sample player routine I used, it was the one you get with the sampler
package, so I probably don't have them). I never use STOS anymore anyway,

because my brain is already fried with languages such as assembely, C++,
scheme, eiffel, etc.

No I didn't. In no way did I say that STOS "isn't up to the job", it
can be very powerful when utilised fully, but all I want is a simple,
fast as possible program. Assembly seems the best choice for this.

And what happened to a little courtesy? Most browsers have a button
to send as mail and news, so is it too much to ask that you press
that one instead?

>Could someone please point me towards some C source code for using
>joysticks. I'm using Lattice 5.5 on an ST.

The Compendium says `While no direct TOS support is available for
reading these ports [the CX-40 style joystick controls], is is
possible ussing the IKBD contgroller in one of several joystick
reporting modes.'

It seems it's pretty complicated to read the joysticks in C. I hope
somebody else has already written something to do it, as it involves
writing to the IKBD chip. There is one mode of this chip in which it
translates all joystick position information into arrow keys.

Regards,

Well, better late than never. I remembered I once saw such a routine
in Motorola's M6800 Microprocessor Programming Manual, and yesterday
I found it. It's 1975 vintage code, but what the heck! Mind you,
if it doesn't work, blame Mototola - not me.

Has anybody successfully sent an image to GemView 3 via Xacc ??

Everytime I try it I am greeted with 2 bombs and Gemview dies.
Receiving images from Gemview via XACC is not a problem and works
fine.

Is this a known problem with Gemview 3 or is it a bug at my end ??

Thanks in advance for any help..

I am trying to write an atari device driver for a DOS serial mouse.
I have the USART setup so that it recognizes the mouse, however,
I don't have any documentation on what information the mouse
produces. What I need is the details of the mouse packet, i.e.
order of information, size of each piece of information and the
specific values for the mouse buttons. I have a 3 button mouse.

Thanks in advance.

Unfortunately, MagicMac cannot read ST formatted disks, only PC
formatted ones.

If you format some PC disks on the Mac (using PC exchange) and get
some kind soul with an Atari to copy MAGE on to the PC disks, you will
be able to install MAGE on your Mac (Whatever MAGE is !!!).

Hope this helps..

Steve.

2682. ST virtual drive ?

Newsgroup: comp.sys.atari.programmer
Date: 1996-06-14 00:00:00 UTC
From: rosen@sunny.bahnhof.se
Message-ID: <4prd3f$80a@funny.bahnhof.se>
Source record: 9525

Does anyone know how to create a virtual drive on the ST , or , where I
can learn about it ?
From my point of view , that is a program that respond to a TOS disk
drive. It may get a message like "CD test" for example , or messages
dealing with data channels traffic.

Thanks for any answeres.

A program called <Pysgham2> can do this and more.
It can :
- create virtual drives like M: for C:\auto if you want,
- lock a partition to avoid programs to write on it.

You can find it in <ftp.cnam.fr/pub/Atari/Disk/pysgham2.zip>

2684. Help With Super Charger

Newsgroup: comp.sys.atari.programmer
Date: 1996-06-14 00:00:00 UTC
From: bjr@EbiCom.net
Message-ID: <4pskea$2rn@Einstein.ebicom.net>
Source record: 9527

Anyone out there able to write drivers for the Super Charger?

I'm in need of a simple midi driver for my Super Charger...
I'm assuming all that is needed is a driver for dos that
locates and enables the atari midi ports for dos applications to
use.

If you can do this...or know of one already in existance...please
reply to this post.

Also, note that many of the dos programs allow you to enter a hex
address for the midi port. Would entering the ST address for the
midi ports work on the Super Charger? Or would special drivers
be needed? If someone can tell me the hex address for the atari
midi out port...i'll give it a try.

Thanks,
Brian

2685. 1040 STe Midi Question

Hi! I'd like to know if anyone has ported the most recent version of trn (3.6) to MiNT. I'd also like to hear from people who have compiled trn on their own, regardless of version, just to see if this is something that I could attempt with my limited skills.

Midnight Escape's 1st 8,000+ file CELEBRITY/Misc Model ADULT CDROM
(BIGGEST & BEST affordable stars/model CD-ROM you will find! Guaranteed!)

-=-Web orders: www.mid-night.com (Check, Credit Cards, First Virtual)-=-
** For phone orders (USA number) 804-686-1271
Order via BBS 804-686-3062 (email: cds@mid-night.com)
$24 each (plus $2 shipping, $5 shipping outside USA)

Just a FEW of the ME#1 CD-ROM's features are:
- 460+ pics of Cindy Crawford ** FOREIGN ORDERS: **
- 200+ pics of Elle Macpherson --WELCOME--
- 200+ pics of Alicia Silverstone
- 200+ pics of Mariah Carey
- 200+ pics of Christina Applegate (Kelly Bundy) **NUDES**
- 200+ pics of Sandra Bullock
- 100+ pics of PAMELA ANDERSON aka Pamela Lee!!
- 100+ pics of Patricia Ford (sexy hot famous model)
- 50+ pics of Elizabeth Berkley (Showgirls star)
- 50+ pics of Christie Turlington (hot supermodel)
- 50+ pics of Jenny McCarthy (singled out host, playmate)
- 70+ pics of Singer Paula Abdul
- 60+ pics of Alyssa Milano, nude and clothed..!
- 40+ pics of Sarah aka Jennifer Love Hewitt **BBS READY**
- 40+ pics of Jennifer Aniston from FRIENDS
- 80+ pics of Racquel Darrian / Kelly Jackson (porn star)
- 80+ pics of Anna Nicole Smith
- 150+ pics of Adult Japanamation/Erotic Artwork
- 2000+ pics of other nude stars (too many to list!)
- 2000+ pics of clothed MISC (swimsuit etc) stars
- 1500+ pics of hot AMATEUR models, nude..
(MORE details on content at http://www.mid-night.com/cds.htm)
or call 804-686-1271 to order via phone.

Common info:
* Packed in white shipper, No signs of nudity (Wife protection plan)
* All in all, there are over 8,000 thats EIGHT THOUSAND FILES!
* All pics are high quality atleast 640x480!
* Directories are arranged in NUDE/NON NUDE ordering for easy use!
* MPEG Animations of Stars (Applegate, Salma Hayek etc..)
* Graphics viewing software for Windows/DOS
* CD is BBS ready with detailed descriptions of all files!
* This CD will save you -ALOT- of download/searching TIME!

* Too many more features to list in this message..

This CD represents alot of hard work. Here is the pricing:
$24 each (plus $2 shipping, $5 shipping outside USA)

*For FAST results, visit http://www.mid-night.com/cds.htm
And fill out a order there. We take every method of payment.

*Or call 804-686-1271 to order via credit card over the phone!

*If you dont have access to the World Wide Web and would like an ORDER FORM
sent to you via email, reply to this message at cds@mid-night.com
If you have any questions feel free to email also..

*If you dont trust the internet for ordering, you may logon
Midnight Escape BBS at 804-686-3062 hit C at the new user menu
to order the CD..

Qualifications: You must be OVER 18 & live somewhere on planet EARTH!
NOTICE: Foreign orders add $5 for shipping..

*Wholesale/Dealer/Bulk information/prices available upon request.

2695. loading colour icons from resource

Newsgroup: comp.sys.atari.programmer
Date: 1996-06-18 00:00:00 UTC
From: ajalkane@lk-hp-17.hut.fi
Message-ID: <4q5odp$bi0@nntp.hut.fi>
Source record: 9538

Anyone can help me? I'm trying to load colour icons from external
resource. I don't want to include them in the main resource which
I load with rsrc_load, because it'd probably grow beyond 64k
and because the icons aren't always used. The problem is how
can I convert colour icons ob_spec field and the pointer info
to point to correct places in memory?
The colour icons ob_spec fields seem to be very strange. Unlike
other objects ob_spec fields, which include offsets to the
file, colour icons ob_spec field seem to contain order number.
For example the first icons ob_spec is 0, the seconds 1 etc.

I'm totally lost what I should do, any help appreciated!

Regards,
Arto Jalkanen
ajalkane@cc.hut.fi

Those numbers are indices into the array of cicnblk (I think that's
the right name, I don't have my manuals here) structures which are
I believe immediately after the other arrays of structures.

I assume you have some documentation on how colour icons are stored
in memory once they're loaded? There's a linked list of other
structures, each with details of a version for a particular colour
depth, I imagine the resource file has a similarly complicated
layout.

As I and many others have said before, it's all in the Atari
Compendium.

Sounds like your library is compiled to use short ints, and your program
to use long ints. The filenames on the library ought to stop this though.

2701. 680x0 instruction timings

Newsgroup: comp.sys.atari.programmer
Date: 1996-06-19 00:00:00 UTC
From: gjones@cs.man.ac.uk
Message-ID: <4q95je$jen@m1.cs.man.ac.uk>
Source record: 9444

I've got the Newnes 68000 pocket book which is full of wonderful info, notably clock cycles for all the instructions. However, I'm looking for some info on timings for 68020 and 68030. The 68040, according to this book, averages 1.25 cycles per instruction. Pretty fast. The reason I'm interested is because I was looking at some Falcon code and wanted to see if I could speed it up (I'm still the demo coder speed freak I once was!). I understand that the 68030 (and the 020? can't remember) employs a type of parallel architecture to improve performance, along with hard-wiring of instructions. I can only guess at instruction timings with this lot running...

```
On 14 Jun 1996, Brian Roland wrote:

> Anyone know the HEX address for the midi ports on an Atari 1040 STe?

Should be the same as on ordinary STs :

$fffffc04 (read byte) ACIA Status
$fffffc04 (write byte) ACIA Control
$fffffc06 (r/w byte) ACIA Data

But why not use the operating systems function to access Midi ??

Cheers Peter

I agree that this is not the place to post such advertisements, but what makes it " .. base,immoral, perverted,"? and why are you the authority ? Funny but I have this outmoded notion that consenting adults have the right to do what they want. Has something to do with personal freedom.

All postings to inappropriate newsgroups are immoral, perverted, and corrupting.
Their content is irrelevant.

1) You, of course, _realize_ that by responding to this message you
are also crossposting, right?

2) The morality or lack thereof should not be the issue; the issue is
massively cross-posted advertisements of any type, especially those
appearing in inappropriate newsgroups.

3) See news.admin.net-abuse.misc for more on how to combat this spam.

4) Terminate this thread! Give it no more reason to exist. Start a
new one if you must, but this discussion really does not belong here.

Instruction timings on the 030 are much more complicated, since it
(IIRC) uses a pipelining scheme. The best reference are the Motorola
books, which you used to be able to get for free from a Motorola
distributor (in this part of the world anyway) by explaining that
you're developing code for the 680x0 line. There are 2 or 3 books,
one lists all the instructions & another one talks about the
architecture.

No, but I wouldn't post one anywhere :) Trying to make all the internet
suitable for kids is what the US government tried to do, and
fortunately didn't manage. There's no way you can prevent kids from
accessing wherever they want on the internet.

I agree that posting it here was totally inappropriate and wrong, but
posting it in say alt.sex would not be inappropriate, yet kids can
read that.

You know, everyone is speaking about the "right" to post anything up on
the Internet. But with that right comes responiblity. You must remeber
that not everyone wants to see this stuff and some should even see this
like children. I do wish people who advertise this sort of thing will
stick to speciality newsgroups instead of broadbasing it everywhere, it's
like that in the real world BTW.

And those who feel that 'they' shouldn't have to be protected because the
children must be, do you let your Playboys out where your kids can read
them? Thought so...

Oh really? How many children have the money to buy their own computers
these days? How many children have accounts with the phone companies or
ISPs?

This isn't a free broadcast medium. It does take a level of knowledge and
some non-trival expenditure of money on electronics to access.

So? The real problem isn't some spammer but some lazy slob of a parent
that have no clue as to what their kiddies are up to and expect the whole
world to be thier baby sitters.

Nevermind that the ad itself was not obscene (not even by American
standards which are obscene themselves).

>door, would you post a sex advert somewhere you kew minors would have

"Mr. Maddog" <mrmaddog@prolog.net> wrote:

> You know, everyone is speaking about the "right" to post anything
> up on the Internet.
First, keep in mind that Usenet news is *not* restricted
to the Internet.

> But with that right comes resposniblity.

For example, whoever you are, whichever of this long list
of newsgroups you come from, *why* post it to comp.sys.cbm? *None*
of this has anything to do with 8-bit Commodore computers. I bet
most of the 8000 nude celebrity pics are in jepg format, which
cannot yet be displayed on a Commodore 64 or Commodore 128. I know
this didn't come from comp.sys.cbm. So I could trim comp.sys.cbm
out and still get to whoever sent this to us 'in public', as they
say, 'no private e-mail'. But what about the *responsibility* to
avoid mindlessly posting this thread to umpteen different newsgroups
because you are either too lazy or too unskilled to trim down the
newsgroup distribution list?
Hint #1: if you don't know how to trim the distribution list,
simply do not respond to a posting that was distributed to more
than 3 newsgroups. It's that simple. If you are spreading this
all over the place for no better reason than lack of knowledge or,
worse, pure laziness, *hold* *your* *tongue*. There's someone
else out there who has the same opinion (or close enough) who
is prepared to take the time to avoid this kind of spam
multiplication.
Hint #2: if you don't *know* what a newsgroup is about,
don't post to it. And it is no excuse to say, 'it was crossposted
on my newsgroup, I just hit "reply".' See hint #1.

Virtually,

Bruce R. McFarling, Newcastle, NSW

Eric Noss (mrmaddog@prolog.net) offered:

> You must remeber that not everyone wants to see this stuff.

AND I must also remember that not everyone is required to read a posting with the nauseous word "nude" in the subject line. Goodness me!

Next Tony Greenwood (stosser@airtime.co.uk) cautioned:

> ...postings should take into consideration that minors have just as
> much access to these newsgroups as your consenting adults do. I have
> this personal freedom you speak of, but I dont think it stretches to
> immoral perverted indecency....

Few things will pique an adolescents interest more than for an adult to tell them that something they see as pleasant, i.e., nudity, is "immoral perverted indecency". God, what a weird attitude. You did notice that interested parties had to SEND for this material, didn't you? It isn't distributed on the net and it probably will be MAILED to the recipient. Please note that there was no mention of donkeys, leather, children, etc.

Then Dave Baseley (dbaseley@cartech.com) ordered:

> ....[Blah blah blah (at least three bags full)]....Terminate this
> thread!...this discussion really does not belong here.

It's one of the fundamentals of discuss/debate, Dave, that you don't put forward your views and then imply that there is nothing more anyone else can possibly add by declaring the subject closed!

AND I'M GETTING QUITE TIRED OF YOUR CONTINUAL CROSSPOSTING, TOO, DAVE!

2721. Re: Looking for C joystick sources

Newsgroup: comp.sys.atari.programmer
Date: 1996-06-23 00:00:00 UTC
From: gold@shell.aros.net
Message-ID: <4qi782$8og@news.aros.net>
Source record: 9464

I looked in my old copy of The GFA Basic Book, and it includes code for reading the joysticks. I've translated it into an assembly function for C; hopefully everything works, but I haven't had a chance to test this, since I don't have an ST hooked up at the moment. :) But it's worth a shot:

```
; long joy_addr()

.globl _joy_addr
_joy_addr:
move.w #34,-(SP)
trap #14 ; kbdvbas() -- xbios(34) function
addq.l #2,SP

move.l D0,A0 ; address to table of interrupt vectors
lea 24(A0),A0 ; add 24 to find location of joystick vector
move.l (A0),old_vec ; save the old vector for later
clr.l joystick
move.l #find_addr,(A0) ; insert new routine

; if you assemble this with your C compiler, $16 below should probably
; be written 0x16
move.w #$16,-(SP) ; this code allows the keyboard processor to
move.w #4,-(SP) ; read and send values for both joysticks
move.w #3,-(SP)
trap #13 ; bconout(4,0x16) -- bios(3,4,0x16)
addq.l #6,SP

wait: ; wait for the joystick interrupt
tst.l joystick
beq.s wait
; at this point, 'joystick' should contain the
; address we want
move.l old_vec,(A0) ; restore old vector

move.w #8,-(SP) ; this code puts the keyboard processor back
move.w #4,-(SP) ; in the normal mouse mode
move.w #3,-(SP)
trap #13 ; bconout(4,8) -- bios(3,4,8)
addq.l #6,SP

move.l joystick,D0
addq.l #1,D0 ; D0 now contains the address of joystick 0
rts

find_addr: ; A0 points to the input data
move.l A0,joystick
rts
```

You should be able to use it as follows:
unsigned char *joystick0; /* address of first joystick */

joystick0 = joy_addr();

The second joystick's address is simply joy_addr() + 1. To set the keyboard processor to joystick mode, use
bconout(4, 0x14)
(This is bios function 3.) To set it back to mouse mode, use
bconout(4, 0x16)
You can read the joystick values by peering at the contents of *joystick0. The 7th bit is set when the button is pushed. The 1st, 2nd, 3rd, and 4th bits represent, respectively, up, down, left, and right.

Message-ID: <4qj9ep$shn@pandora.cs.utwente.nl>
Source record: 9466

Hi,

Does anyone know of a program that supports the LAN port on my MEGA STe? I'm especially looking for a program that treats this port as a high-speed midi port. I already tried the HSMOD package, but the system crashed when using Steinberg's Avalon package.
The reason I'm asking this is because I want to speed up sample-transfers between my sampler
and atari. The sampler has a RS422 interface, which is the same as the LAN port, and comunicates trough it using the midi protocol.

As far as I remember there are some options in HSMOD that enable/disable interrupts. Did you find that and/or tried it?

What is your variable declared as - a long? If so use %ld instead.
Be careful that the variable type matches the parameter in printf of which
there are several and many modifies such as 'l' for long.

Well I know I am risking looking like a total Donkey again, but I have to ask :)

The information passed between 2 programs, for instance clicking on display source in CAB will bring up a designated text editor such as Everest? run it and hey presto the source is loaded,

I believe this is held in something called the "COMMAND LINE" please correct me if I am wrong on that, or slap me on the back if I am right :)

Ok is this information held in a specific part of memory, can I simply point to and read the info, I want to get at it from BASIC if possible,

Cheers.............!ynoT

> Everest? run it and hey presto the source is loaded,

There are a few different ways for programs to communicate with each other. Programs using GEM can use the appl_write() - evnt_mesag() combination, thus talking via AES-messages. Commandlines are another (far older) means of communications. For data files it has been agreed upon that any program that finds a filename in it's commandline should open the file associated with that name. Thus editors open the textfile.

> possible,

The command line is held in the second half of the basepage (address of basepage plus 128). The first byte gives the number of characters the command line consists of, then the actual characters follow.

A reasonable programming language should have some means to access the command line in more convenient way. C does it via some pointers that are parameters for the main() function.

It has been quite a while since I used STOS (the kids have it buried somewhere in the games pile), but there should be a command that looks something like:

stuff_I_want_to_know$=COMMAND$

where whatever is on the command line when your STOS proggy runs is passed into "stuff_I_want_to_know$" and you can then do whatever you like with it.

Keep in mind that COMMAND$ is subject to change, so you want to use this as soon as practical in your program. I do it before DIMming arrays or even opening windows.

Unfortunatly my preffered language definatly does not have such a
thing, it was originally made with the specific intention of being a
fully fledged game development system, however many interesting and
usefull serious programs have been made with it, (by other than me I
must add) and the idea for a program that I have (none available as
yet on the atari but a much needed program<?>) would definatly need
the info from the command line, hmmm I live in hope :)

! In article <31d11510.9238419@news.airtime.co.uk>
! stosser@airtime.co.uk said:-
!
! > eeerm sorry?, basepage ?
!
! From scratch ...
!
! A throwback to MSDOS is that the operating system considers a program
! on disk to consist of 3 parts. There is a section for the machine code
! instructions (TEXT), and two sections for data. The first data section
! is for variables which never change while the program runs (DATA), and
! the second section is for variables which do change while the program
! is running (BSS). This layout allows a suitable operating system or
! language to abort a program which is going wrong. Thus, on disk you
! will find a program stored as TEXT+DATA+BSS in that order.
!
! All this information needs storing somewhere whilst the program is
! running - the basepage. Probably due to the pecularities of intel
! processors a whole "page" (256 bytes) was used for this.
!
! When the os loads a program, it creates the basepage first and stuffs
! relevent information into it. Next comes TEXT, then DATA, then BSS so
! we now have basepage+TEXT+DATA+BSS. When the os finally jumps to the
! machine code at the beginning of TEXT the information on where the
! basepage is is passed as well.

Nothing to add, I guess, this is comprehensive.

! TOS maintains a pointer at $602C to the basepage of the currently
! running process. You could try something like this to see if it works
! (excuse my lousy pseudo basic) ...

This certainly is a way to go, if no facilities are provided.

```
! basepage = 32_bit_peek($602c)
! num_bytes = 8_bit_peek(basepage + 128)
! for i = 1 to num_bytes
! a$ = a$ + 8_bit_peek(basepage + 128 + i)
! endfor
! print"command line is";a$
```

As far as I see, this should do the job. However, the peeks have to be done in supervisor mode, as the process pointer lies in the second kB of memory (the first two kB can only be accessed in supervisor mode, the

GLUE chip would launch a bus error if this would be accessed in user mode).

! I do not know how consistent the use of $602C this is across different
! os versions though. You'll have to experiment! :-)

As the process pointer is a documented feature it has to be supported by
every TOS clone, MiNT, MagiC, etc., and really is, AFAIK.

Cheers Peter

Hi Everyone,

I am trying to compile and use E-Gem 2.20 and am having some problems.

I have Lattice 5.5, Pure C 1.0 and I'd like to get it working with Lattice. Can anyone give some pointers to
getting it to work? The docs say I need to use the makefile but I dunno how - Lattice doesn't have a make
utility - will any old one do? Or should I download GNU C and try that? If I do get GNU C, do I need mint to run
it, or will it run under TOS/MagiC?

Any help will be appreciated.... thanx guys,

Hey all you guys, don't waste bandwidth (and forgive me for wasting it too).
Do you honestly believe that the original "8000 pics" article poster gives
a rat's ass about netiquette? If we give it more exposure, that's just what
the poster wants.

I say we just ignore it and go on with our respective newgroup discussions.
If he insists, we can all personally and *privately* volume-spam-mail his
account. A breach of netiquette is ignorable, an insistent b1FfHeaD should
be stopped with his own methods.

I have had a few replies to the command line problem, a couple of possibilities are in the pipeline, but due to STOS being STOS then they have problems,

I really hope this isn't too lame, but would it be possible for someone to knock up an assmebler prog that when run would place the info into the post mortem area as it would be safe there, no matter what,
so original program runs ....then calls..

prog that puts filename into post mortem

that prog then runs my prog

i retrieve the info needed and act,

then my program eeeerm runs the original?, eerm or would that run auto or would i have to have that info so as to re run the original?

Cheers.............!ynoT

Not quite. DATA corresponds to variables which have an initial value.
Both DATA and BSS are variables, though.

> I do not know how consistent the use of $602C this is across different

There is a legal way to obtain the basepage address for the currently
running program, for all versions of the OS. It is documented in the
Compendium.

That's none to clear, but what about a program that acts as a shell for your STOS proggy? You simply send the full path of the STOS prg on the
command line followed by the desired STOS prog's command line; the shell writes the command line to a temp disk file (we can call it
"command.txt") and then runs the STOS prog, which then opens the command.txt file, and if appropriate, deletes it.

Easily done, I could knock that together tonight if it will serve your needs.

I thought it best not to confuse the issue too much, as it really
depends on the language implementors. :-)

I know about $602C and the parameters passed on startup. Is there
another way? [I dont have a Compendium :-( ]

While I think of it, is the "undocumented" pointer to parent's
basepage documented or undocumented still?

> possible,

Well, AFAIK there is this system call called "exec". It will start your Programm with ypur comandline and your environment. The Pathname, the comand Line, and the environment are Parameters for this call. It executes the named Program and returns back. I don't know how it is used in basic, but it works in C.

Now in the called Programm the simplest (only) way in C is to name two parameters for the Comand Line, i.e. an integer holding the number of parameters, ant a Field of Strings holding the parameters. then you can just read them out.

I have no idea how to do that in Basic, since the last time I used Basic for a serious Program I was sitting in front of a C64...

This might seem off topic, if so I'm sorry but this is rather important
to me so here goes. I would of posted this in the other Atari news groups
but nobody really reads those.

Is anyone in the Lima or Findlay, Ohio area going to the MIST Atari
show in Indian July 13th?

I'm wanting to go, but my car is unlikely to make it and would like
to know if I could ride with someone else. Forking out some money for
gas in not a problem.

Please e-mail ASAP if a ride to MIST is possible... thanks for listening.

Hello all,

I'm just wondering, how many ST's are around with less than 2 MB of RAM?
Has the Falcon more than 1 MB ?
I'm asking because my application does't work very well with only one MB
and I wonder if it's worth the time optimising it to reduce it's memory
requirements.

Huh? always? I'd say it depends on the amount of work and on the improvement possible.
Especially if 80% (ca 300Kb) of the code was not written by yourself, and you have to understand it first.

if rsh_vrsn and 4 is not zero this is an extended rsc file.
If it is then there is first appended to the file a table of longs
the first entry is the real length of the file. The second is the offset
from the beginning of the file of ciconblks. (if it is -1 there are none)
this points to a CICONBLK pointer table which is a table of 0L for each
CICONBLK. It is terminated by -1L. It is followed with the following
variable length structures for each CICONBLK.
ICONBLK monoicon; /* the standard monochrome rsc */
LONG n_cicons; /* Number of different CICONS of different res.*/
WORD mono_data[x]; /* monochrome bit data *
WORD modn_mask[x];
char icon_text[12];
for each CICON present for this icon.
WORD num_planes;
LONG col_data; /* place holder calculatee during loading */
LONG col_mask;
LONG sel_data;
LONG sel_mask;
LONG next_res; /* 1L == more icons follow */
WORD color_data[n]; /* the bitmaps in 'vdi standard format' */
WORD color_mask[n];
WORD select_data[n];
WORD select_mask[n];
```

Sheesh--are you certain? I don't know any ST owners who didn't
eventually upgrade to higher than 1 meg. Virtually every ST user (and
certainly every STE user--since it's so easy to upgrade) I know has
upgraded to 4 megs.

If there is a sinlge STE user out there today that honestly uses his
STE regularly and still hasn't upgraded to 4 megs, this is certainly
a good time to do so. I'll bet you could get 4 1-meg 30-pin SIMMS for
scarcely $50-60 US. And I'd say that's a conservative estimate.

You may be right, though... Perhaps a majority of ST users haven't
upgraded. I just find it odd if that's the case.

>eventually upgrade to higher than 1 meg. Virtually every ST user (and
>certainly every STE user--since it's so easy to upgrade) I know has
>upgraded to 4 megs.
>
Your right to a point, I would be suprised to see any STe owner with
half a meg, and very suprised to see any serious STe user with the one
meg,
But the only people you can be pretty sure of having more than one
meg are serious STe users, the guy with an ste who plays games, has a
wp, goes on the net, what reason has he to upgrade to 2 or 4 meg?,

The STFM owner will be stuck at one meg, alright lots of you out
there with more I know, but on liners only account for ten percent of
ST owners, There are more STFM owners than STe, and its a total pain
in the arse to upgrade FM, Financially at least,

I would say that most of the ATARI ST owning population have one meg,
you look around and see how many 2 meg hungry software packages there
are, because theres a couple of hundred one meg ones for each you
could name, if 2 meg was the norm then ?.....

I have a 2.5 meg STe, but if I wasn't a programmer then I could live
very happily on one meg,

Anyway they are my personal thoughts :)

Cheers.............!ynoT

We are looking to recruit an experienced 3D Flight Simulator Programmer to work in the West of England for one of, if not THE largest developer of interactive entertainment in the UK.

You will have experience of programming flight simulators for the home entertainment market and will have a good understanding of the techniques required to produce a first class 3D title.

Salary is competitive and this position is available now.

For more information, please reply via private email or call Paul Rose on 0181 423 3400.

We look forward to hearing from you soon.

Well, I believe that most people who still use their Atari regularly
have upgraded the memory in order to take advantage of the newer multi
tasking AES/OS...however, for this very reason, I'd think that minimising
memory requirements is a good idea...of course you do have to consider the
trade off...if it really slows down performance, or takes out features that
are likely to be used several times a session, I'd vote to use the memory
available. A good idea is to try to make the application so that it can
run in 512k of ram, yet take advantage of all the memory available. This
way those with 512 or 1 meg machines can use your program, and those with
2,2.5,4, or more meg can allow the application to take as much or little
as he wishes...deciding speed/feature VS. memory requiremnets for himself.

Personaly, I use Geneva, and find my self most often limiting the memory
used by each program to the minimum possible, and loading several
applications at once. Exceptions to this rule are memory intensive
applications like DTP, Graphics, large digital sounds, or coustomised
packages like KCS Omega, or Logic...in these cases I give them all the
memory I can...it makes them run faster and more cleanly.

Good luck at any rate,
Brian

2769. Ataris new chance ? JAVA and the "mini-networks-computer" ??!

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-08 00:00:00 UTC
From: joogn@FB1.FHTW-Berlin.DE

having heard recently about JAVAs possibilities to "free us"
from Bill Gates and the intention of java to run applications
with very little memory consumption, or centralised
computer-networks, it occured immediately to me that a classical
Atari should do with that, quite fine ...

if the marketing-devision of atari (if they still have any :)
could work it out this time, "we Atarians" could expect pretty
nice time ahead of us ...

nobody needs a 200Mhz computer with 64MB RAM to run his/hers
operating-System, except the ones being tied to Microsofts
products ...

Escom tried to put out the Amiga as the network-computer again,
but the most certainly lacked much motivation, coz they failed
even before they had started it up in the first place ...

i'll see all those stupid PC-faces when little STs or even F030s
will do away with all this stupid Mircosoft-stuff ...

hopefully cheers

Well, Java is an iterpretative Language. So a slow Computer like the ST wont do it too fast. There are People developing Online Compilers for other Systems. This means, that the code is compiled and imediately run. That may be a solution for the Atari. Eventually the Compilation will get fast enough for the networking conection. Then this is useful.

> if the marketing-devision of atari (if they still have any :)
> could work it out this time, "we Atarians" could expect pretty
> nice time ahead of us ...

Well, Atari is not expected to do anything for that. I remember someoner around in the Net started to port the Java Interpreter from Sun for MiNT. Maybe that is a start.

> nobody needs a 200Mhz computer with 64MB RAM to run his/hers
> operating-System, except the ones being tied to Microsofts
> products ...

Why should Microsoft not getting on with writing Programs in Java and get on the nerves of all the Computer Owners who got around it so far?

> Escom tried to put out the Amiga as the network-computer again,
> but the most certainly lacked much motivation, coz they failed
> even before they had started it up in the first place ...

Well, the missjuged their financial capacity. They had to sell Amiga before they could bring them out in their shops. So now Amiga is again a Computer for a few people doing funny things and calling them Multimedia.

> i'll see all those stupid PC-faces when little STs or even F030s
> will do away with all this stupid Mircosoft-stuff ...

Well, dream on. Microsoft will not be sleeping, and they wil start to integrate Java as much as possible into their System and get it running. I more think, that Intel Will be looking like a horse when all the Standard Software is developed in Java So everybody with a cheap Computer can run it.

2771. printing of Icons with VDI?

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-08 00:00:00 UTC
From: eglis@ubaclu.unibas.ch
Message-ID: <1996Jul8.113025.46708@yogi.urz.unibas.ch>
Source record: 9414

Hi all,

Does anyone know how icons can be printed with VDI?
What I would need would be the raster functions on printers.
I suppose, I can't use the Polymarker function, since the dot mark won't be
a true dot on some printers. (otherwise I could print the icon by printing all
it's dots).

thanx, Simi

2772. STOS Scrolling

2773. HELP *C* and signal/alarm for Kermit!

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-09 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4ru3uc$3m9@madeline.INS.CWRU.Edu>
Source record: 9416

Atari read this. Can someone HELP???
I don't know *C*, tho I have programmed for years in other
languages. However, I undertook to recompile Kermit to its latest version.
The last was (189), from '93. The sources are now up to (192 beta).
I have MWC ver. 3.0.9. The Atari version is a small subset of the whole thing.
We are stuck with a vt52 emulation, altho most thing it connects to need
at least a VT100. It has DIAL and SCRIPT, and many other goodies.
But it NEEDS a version of signal/alarm that is common in UNIX.
I don't want to compile it under mint, cause it wants GEM.
MWC has a signal.h and event_multi in aesbind.h. Can't these be used to make
a dummy but functional signal/alarm??? I have compiled everything that doesn't
need s/a, and it works. Using HSMODA6, it runs at 115.2 KB in a TT.
SURELY, someone, somewhere, has tackled this problem before?
Or would be willing to help me do it myself? You would get full credit
for your help.

There is no exact extension that lets you do this on a FM, if STe
then there are extensions for accessing the blitter chip that will
allow it,
It really depends on what you are doing and how much scrolling you
want to do, There are plenty of "tricks" and ways to do everything in
STOS,
If you want constant scrolling in a game then any language has
trouble but even that can be overcome,
Let me know what you are doing and how much you want to scroll?, i
know you say 1 pixel, but how many times?

Face it, Atari is dead as a dodo. Don't expect anything from "them".

> nobody needs a 200Mhz computer with 64MB RAM to run his/hers
> operating-System, except the ones being tied to Microsofts
> products ...

Someone else already mentioned that Java, being an interpreted language, requires quite a bit of processor power. Also, the browser packages which are around these days are pretty complex beasts. They also tend to be performance and memory hogs. To support such applications, you need a stable operating system with good communications support and more advanced features like robust multitasking and threading. Thinking a little more about it also reveals that much of the Web's fascination for average people comes from the graphical representation, i.e. from animation and colorful pictures. These are all things the ST line never was designed for. (The Falcon is, of course, better suited for color graphics.)

Worst of all, I think the "network computer" idea won't be accepted by the marketplace, no matter who makes the NCs. So even if the no-longer-existent Atari had a killer machine for the purpose (which they don't have), it would, IMHO, never become a smash hit.

I'd be glad if I'm proven wrong, but the only hope that I put into "the Atari market" is that at least for a good while I can find someone to repair my TT if it needs fixing.

You don't need a browser to run java programs. It looks as if many
Software houses begin to use Java as a programming language for bigger
aplications. Those applications won't be distributed as aplets, but in
Java 8 bit pseudo Machine code. They could be compiled to a real Atari
Application and then run quickly.

> To support such applications, you need a

> no-longer-existent Atari had a killer machine for the purpose (which
> they don't have), it would, IMHO, never become a smash hit.

You mean the Oracle Thing. It is interesting, but the problem is, that
most people buying a Computer really want to buy a Playing Console. At
the moment Networking is not too much interestin to the people. The so
called Internet Boom did not bring the Computer market into much higher
regions, and the internet just got slower with the WWW, because many
people now get their penthouse Pictures via WWW instead of buying the
magazime at the kiosk. So I think the time has not come for the Network
Computer.

> I'd be glad if I'm proven wrong, but the only hope that I put into "the

> repair my TT if it needs fixing.

Well, we could try and persuade someone at Medusa Systems, Overscan, or ASH to do the job Atari did, and serve as developer source.

I personaly would prefere Medusa Systems to do it, because they also develop the New Computers that are most likely to become the new Standard Atari.

> convenience. :-)

There are no "Net Police" (unless you're an AOL subscriber, they have a history of
"cooperating" with the FBI to entrap otherwise law-abiding citzens).

Mail bombing is always inexcusable. Very tempting, sometimes, but still inexcusable.

However...

At one time I began writing a cancelbot becasue of idiots like your "Admiral." It wouldn't
be difficult
to finish it. I'd release the source code. A corollary program is the BounceBot, that
simply bounces
unwanted email back to the originator. This has the (desirable?) side effect of
automatically mailbombing
anyone who mailbombs you, if you know it's likely to happen.

Anyone interested in the code?

Posted for someone whose Usenet feed is still flaky (their comp.sys.atari.* groups are only getting about one article every few days)

I'll forward any responses I get...

--- SNIP ---

I am looking for someone with STOS experience who can help me with sprite collision detection.

In particular, I want to know how to detect whether two sprites have collided, and do something if they are touching. This is to allow the player's on screen person to "pick up" and object. The object would be represented by a sprite.

Any example code would be appreciated.

--- SNIP ---

Hi folks,

To cut a long story as short as possible, due to my own stupidity, my hard disk is currently "down". I fully realise I can be a complete plonker at times so I have lots of backups. Incredibly, it has been "inexplicable floppy failure week" - more died this week than have done in the last 9 years put together.

Consequently, it's going to take me some time to figure out what has gone altogether and what can be salvaged. I'll at least try to respond to email but don't expect miracles!

2783. Trap vectors

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-12 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4s6h5e$4nm@inca01.inca.co.nz>
Source record: 9426

I was just wondering which of the 68000's TRAP vectors are used by software (apart from the obvious OS vectors, of which I am familiar).

A few years ago, I found that I was including the same pieces of code (system interrogation, cookie Jar creation/interrogation/editing, etc) in nearly all of the custom apps that I was writing for various people.

So, I wrote a smallish (16k) TSR to be loaded at boot time that contained all of those functions.

In order to simplify the program-to-TSR interface, I used the TRAP #0 instruction to call it from the main app.

However, it occurred to me that someone else may be using that vector.

Firstly, does anyone actually use that vector, and if so, what for?

Also, if that vector has already been claimed by something, how do I detect it, and what other TRAP vectors are available for me?

AFAIK, the only claimed vectors are traps 1, 2, 13, 14, which leaves the other 12 (0, 3 through 12, 15) free. I therefore chose Trap #0.

Now that I am starting to write more horizontal apps (as opposed to the vertical apps I have been doing so far), I wish to ensure that my Toolbox (the 16k TSR called via a "Trap #0" instruction) will not interfere with more mainstream apps.

>I'll forward any responses I get...
>
Ok a quick and easy answer would be, I presume then you friend has
internet access, so why not join the STOS mailing list, normally used
for just such questions and answer sessions :) although a bit quiet at
the moment because most of them are students and gone home for the
school hols :)
>--- SNIP ---
>
>I am looking for someone with STOS experience who can help me with
>sprite collision detection.
>
I do STOS :)

>In particular, I want to know how to detect whether two sprites have collided,
>and do something if they are touching. This is to allow the player's on screen
>person to "pick up" and object. The object would be represented by a sprite.

Sorry there is no straight and simple answer, Do I take it your
friend doesn't have a manual, not being funny here but its pretty
simple in there to do sprite detection, you could even use a colour
detection and check for irregular shaped objects,

But by far the best method is to use the Missing Link extension "MANY
OVERLAP" command, this will detect between hundreds of objects on
screen in lightning speed,

*** tip to any stossers, manyoverlap for multiple object detection is
far faster than the straight overlap that detects one object, its
because the new "many" commands use a different code ***

If you havent got that extension then the best advice would be to get
some copies of STOSSER diskzine, there are 26 issues (STOSSER 27 due
out soon) and each has a minimum of 40 articles, with over half STOS
related, the rest of the disk is filled with stos source, thats over
15 meg of stos source in the 26 issues,
Theres plenty on sprites and sprite detection, including my "idiots

guides to using bobs" etc, try floppyshop in scotland,

There is no way I could send you an example routine as I have no
idea what extensions you have or what you are really trying to
achieve, some of the aboive would hopefully help ????

Cheers.............!ynoT

2788. Atari Binaries - Inaugural Message

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-13 00:00:00 UTC
From: starship@3rdplanet.com
Message-ID: <552425755.432033.A.starship@3rdplanet.com>
Source record: 9431
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,comp.sys.atari.advocacy,comp.sys.atari.st.tech,comp.sys.atari.programmer,alt.binaries.atari,alt.binaries.atari.d

This message inaugurates both alt.binaries.atari and
alt.binaries.atari.d

CHARTER:

alt.binaries.atari is for distribution of freeware, Public Domain, and
shareware patches, programs, etcetera, intended for Atari and
compatible computers. alt.binaries.atari.d is for discussion of the
content of alt.binaries.atari and should never contain binary files.

The following are explicitly inappropriate for posting to either
alt.binaries.atari or alt.binaries.atari.d:

- Copyrighted software without the EXPLICIT permission of the
copyright holder to post the software.

- "Chain letters," "get rich quick" schemes, for sale messages,
or commercial solicitations of any kind.

- "My computer is better than your computer" messages, or
discussions of the relative merits of any computer system. These
discussions properly belong in the various .advocacy groups (or
alt.flames in some cases).

- Any posting whatsoever by Peter Sinclair-Day; he does not own
an Atari or compatible computer, does not use an Atari or
compatible computer, and does not hold the copyright to any known
software.

Very large binaries (e.g., in excess of 500k) should be uploaded to an
ftp site (or several) first, and the availability (with full path)
announced in a.b.a; only in the case of a specific request by a user
who has no ftp access should such large binaries be posted to the
newsgroup.

It is suggested that a short text message be posted in a.b.a
immediately before posting a binary, explaining the purpose of the
binary, the copyright status and distribution policy pertaining to the
binary, system requirements for use of the binary, and any special
information which may assist in determining the desirability or
undesirability of downloading the binary.

This is an unmoderated group. However, it will be closely watched by
the undersigned, and any blatant violation of copyright law will be
immediately reported to the violator's postmaster and the copyright

holder. Violations of netiquette will be referred to the appropriate
postmaster if it is deemed necessary.

Boris, AIUI, ANSI is merely VT100 with color extensions; Tim Miller created ANSIterm, and there's source in his tsource.zip file (which is now PD). You ought to be able to crib from that.

Of course, if all you want is a generic console driver, use the ANSIST TSR that goes in the AUTO folder.

Really? I'm using Mint 1.12h3, and it's generally been rock solid for me,
even when I'm doing programming. Of course, I _am_ running it with memory
protection on, so that may make a difference.

I'm sure it does. If there were a plug & play 030 that could replace my
68000 CPU, I'd try that. There's not, AFAIK, however, so I'm stuck with
MINTNP in the AUTO folder when I want to run MultiTOS. I think my
version of Mint is 1.12f-something, I take it there's a later binary
available?

CAB doesn't really hog memory. It is only sloppy bloat programming from guys who write code for the Windows 3.1/95/NT environ that sees fat and greedy software released. They have little choice in the matter with the environ they choose to run. A JAVA interpreter should be able to be compiled for the Atari platform (perhaps '030 or better), but the big problem will be in getting Sun to agree to license the source to you. To get hold of JAVA source requires big biscuits despite the net.myth.gossip that says JAVA will be a multi-platform thing for anyone who wants it. Get real Sun!!, thats why we have only seen major corporations come out with JAVA plug-ins so far...

In this instance, Portal is correct; I'm sorry, I must have unconciously added
the ".st" in the middle of that.

> I for one have been right here on comp.sys.atari.8bit on and off for nearly

I can email you a complet newsgroups list, if you need it. It's rather bulky
at about 350k, but if Portal won't tell you waht exists, I will. IMHO, any
and all "warez" groups that exist are pirate groups, and I won't subscribe to
them, even if I can find them (there are several listed in my NG file).

Not only that, but an unmoderated group doesn't depend on the whims of one
person to give it content.

> > comp.binaries.atari.st should be removed. Despite the continued
> > presence of a capable moderator, its submissions declined to the point
> > where virtually nothing was valid for the group.

> This is probably a relatively valid reason for removing a group.

This would be a valid reason /IF it were true/, but it is not. Submissions
wer made - and ignored. I submitted several files in the omnths prior to the
group's demise, and I have seen others state the same thing; no response was
ever forthcoming from Annius. I don't know if that means he did not get the
files, or simply chose to ignore them.

> > The Atari ST is no longer a very active platform,
>

> used to "support" the suggestion/recommendation/decision to remove a group.

It's tantamount to saying that "the 286 is not a much used chip any more, so we will no longer write software that does NOT use 386 opcodes." Granted, there is a lot of software that won't work without those opcodes - but probably 90% of the current DOS-based software, including most network drivers for Novell networks, work just fine on 286 boxes. I doubt that the owners of those networks using 286 servers and clients would be very favorably impressed by anyone who told them that they would be required to give up their existing hardware platforms.

> my numerous rants on THIS subject in groups like comp.os.vms and one or
> another (I forget which) of the Windows NT groups...

It's also the way things are done, and frankly, it blows. Getting an alt. group for Atari binaries effectively removes the controls exercised by the "Big 8" cabal (and such a cabal obviously exists, else it would not be necessary to put a new group proposal to a "vote").

> > Annius V. Groenink <avg@cwi.nl> posted messages to the group asking

The fact that the question was posted in comp.sys.atari.st is true. The allegation that "the vast majority agreed" to rmgroup it is either a mistake,

or an outright lie. Since I don't know if the person making the statement
knows the truth or not, I will assume it's a mistake.

Yes, well, thanks but it doesn't seem to have worked. I'll ask here - does
anyone have direct root@domain access to send the necessary control messages
to try again to create these groups? I can email the necessary header(s) and
text if you aren't sure how it's done.

2798. C programming stuff

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-15 00:00:00 UTC
From: rsg0910@iglou.com
Message-ID: <DuLxIq.83o@iglou.com>
Source record: 9436

Hiya... I've been reading up on C programming, and following the programming examples and coding of other programs out there. I've read through the LazyBBS code in the Crawly Crypt 2 CD, and the Fnordadel in the Umich archives. Also picked up on Mark Williams C (looks like version 3?), Prospero C (version 1.43), and Personal Pascal (vers. 2) from one dealer at the MIST Fest in Indianapolis.

What I'd like to know is if there are any newer versions of the above programs, especially MWC and PP. I've picked up the free public version of the Atari ST port of C in the Umich archives, though I've not read through the whole thing yet. I'm gonna try my hand at some BBS programs and doors in C. Since Transcendence has not had any updates for a long while, and a voice chat with Wayne Watson reveals he may or may not continue to port it over to C from GFA Basic, I'd like to try either writing or modifying code to use the existing files.

Also, I've tried searching for Atari books on this, as well as places on the Web and FTP sites. No go, unless I'm looking in the wrong places. Just about all of the places for C and C++ programming I've come across are for either the IBMs or Macs.

Hi Boris,
I tried to email my previous responses to your pleas for help, however
they both bounced, so here is a public response.

As far as Lattice C is concerned, the latest (5.6) has make, although
I haven't actually used it. If you're just doing multiple compiles &
links (and you have _some_ level of Lattice C v5), why not just use a
project file ... they're easy to set up.

If you'd like to continue this via email, please feel free to do so
(but please make sure your reply address is reachable :-)).

First of all, I say well about time with this idea! I hope that many
will freely UL and DL as, for me at least, I have only one Atari BBS and
Umich files are hardly updated with newer stuff. Some people don't even
have a BBS to get the stuff from. I'll frequent this area as much as I can.

Well done Richard! :)

So maybe someone should look into Inferno and see if it has better
licensing terms for the Atari platform. AT&T announced it about a
month ago and has something about it on their web site if interested.

It's premise is more general than Java so it may be a better choice
in the long run anyway. Wayne

Hi,

Has anyone got some assembler source to save a .gif from ST-low or a
PI1/NEO to GIF conversion routine. I need this to save screendumps from
320*240*16 (4 bitplane) into a common picture format - and PI1/NEO only
hold 5/6 of the screen.

Thanks,
Yiannis

2806. Trap vectors

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-16 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <4sgv6u$ooi@inca01.inca.co.nz>
Source record: 9349
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

I was just wondering which of the 68000's TRAP vectors are used by
software (apart from the obvious OS vectors, of which I am familiar).

A few years ago, I found that I was including the same pieces of code
(system interrogation, cookie Jar creation/interrogation/editing, etc) in
nearly all of the custom apps that I was writing for various people.

So, I wrote a smallish (16k) TSR to be loaded at boot time that contained
all of those functions.

In order to simplify the program-to-TSR interface, I used the TRAP #0
instruction to call it from the main app.

However, it occurred to me that someone else may be using that vector.

Firstly, does anyone actually use that vector, and if so, what for?

Also, if that vector has already been claimed by something, how do I
detect it, and what other TRAP vectors are available for me?

AFAIK, the only claimed vectors are traps 1, 2, 13, 14, which leaves the
other 12 (0, 3 through 12, 15) free. I therefore chose Trap #0.

Now that I am starting to write more horizontal apps (as opposed to the
vertical apps I have been doing so far), I wish to ensure that my Toolbox
(the 16k TSR called via a "Trap #0" instruction) will not interfere with
more mainstream apps.

That is just because people ported Java only to the major Platforms at
the moment. Javasoft (doughter of SunSoft) do licence the source of the
JDK to everyone who won`t use it for Profit for free. You will have to
sign a Non Disclosure Agreement and then you can Download the sources
from their ftp Server. You can not expect Javasoft to do all the porting
to all the Platforms available.

Erm, no. Java is compiled. It's relative Java-script is interpreted.
It _is_ still byte-code compilation, which means that there is overhead
in interpreting the compiled program, but it is much lower than the
overhead of dealing with full interpretation like javascript.

This means that the Atari should be able to deal with Java much like
other machines (ie: Not much slower than native code).

Downside: I have reports that Java requires _enormous_ amounts of memory
to run. Can someone confirm or deny that? Reports I'm hearing are on the
order of 'if you have less than 16MB don't even bother'.

Heck, didn't Microsoft finally drop all support for other languages and go for Visual Basic as it's 'official' language, to minimize support requirements?

Dollar Bill doesn't like to look foolish, and I think the arguments behind that move would make him look that way if Microsoft suddenly embraced Java after all they said recently.

Sorry if I'm a little incoherent. About to dash for work.

Bonjour,

j'ai achetï¿½ un gps portable Garmin 38 pour faire du bateau. Les gps
portable ï¿½tant dï¿½pourvus de clavier dignes de ce nom, l'entrï¿½e des donnï¿½es
est assez laborieuse. Il existe des logiciels sur PC et Mac pour
communiquer, via la prise RS 232, mais je n'en ai pas vu sur Atari.
Quelqu'un a-t-il dï¿½jï¿½ vu ce problï¿½me traitï¿½ quelque part?
Merci d'avance.

Hello,

I bought a Garmin 38 gps for using on a boat, but this kind of gps have
not a true keyboard, and entering the data is quite long and difficult.
There are softwares for PC and Mac for communications with the RS232
socket, but I have never seen one for Atari computers. Has any body ever
see this question dealt?
Regards.

> >> this group are primarily interested in a place to illegally
> >> repost copyrighted software.

This comment (whose poster may remane nameless unless he wishes to step forward at this time) is frankly slanderous. As the proposer of the new groups, /and/ an established software author, I take personal umbrage at the expressed implication that I am a pirate. I suggest you ask the former BBS sysop and the author of RatSoft BBS how I feel about pirates - of course, he may not be aware of just who blew the whistle on his pirate activities.

> >> the moderator and the readership, it is now removed.

This is patently untrue. Annius posted one or two messages in comp.sys.atari.st remarking that he was planning to have the group rmgrouped, but the "vast majority" most of the readers most certainly did NOT agree to remove the group. I think most of us simply found it impossible to get anything past the moderator. Personally, I voted to retain the group.

An now, back to Guy's remarks:

> I attempted to post to this group on more than one occasion - at

>
> guy@swampdog.demon.co.uk

It certainly appeared to me that the rmgroup was "railroaded" though.
No voting results were cross-posted to the comp.sys.atari.* groups. By
that time, however, the rmgroup was a /fait accompli/, as they say, so
there was little anyone could do about it.

Any book that says it teaches C programming should hopefully do that.
If the book is reasonably good, it shouldn't matter much if it happens
to be named 'C programming with SuperC v 4.5.2a for the MegaMic III/2'.
ANSI C is (more or less) machine independent.

>If you find any, let ME know, too. I am going crazy with the differences
>between different versions of C. The libraries are ALL different, and
>you can't find out what the other were supposed to do.

Uhm, what differences?
The ANSI standard is rather specific about how everything should work.

If you're talking about Atari specific things like GEM etc, that has next
to nothing to do with C, but even then the differences are relatively
minor.

The MGIFv5 sources are somewhere around 700kbyte (excluding all libraries)
and compiles fine under GCC, Lattice and TurboC/PureC (I've never tried
them under any other) with very few '#ifdef' modifications.

A couple of data structures used by the AES and VDI (and I recall one from
GEMDOS) have somewhat differently named components under the three
compilers for some reason, but that isn't difficult to find or handle.

I remember fetching some rather good AES/VDI documentation from
atari.archive several years ago, but I can't recall the names(s).

The MWC lexicon contains a wealth of examples. Also the C programmers
reference from Kernigan & Richie is well worth a read. I believe it
was updated to cover ansi so try and get an older version. Any C K&R
programming book will suffice for the basics. There is documentation
available off the net but I don't know where and can't vouch for its
quality.

The only atari reference book I know of which is still in print is the
compendium, reputed to be extremely comprehensive.

I need the ability to multitask GEM programs, so, yes, I tried to use
MultiTOS. I can't say I'm terribly impressed with the speed, and since
I can't keep it running long enough to tweak it, I don't imagine I ever
will be.

The new MagicPC demo has impressed me, however, enough that I intend to
buy MagiC for my Mega STe as soon as the money comes together.

Hmph... So they went poof long ago. Found an 800 number inside the main manual. Now that they're gone, I'm wondering if it's possible to post all the updates on one of the Atari binaries, one of the newer ones. The ones for csd and so on would be good.

Has anyone played with Lattice C, version 5.60? How good is it?

: If you find any, let ME know, too. I am going crazy with the differences
: between different versions of C. The libraries are ALL different, and

For now, it seems you may have to install MiNT, and install gcc with it. That way, you have a working Unix-like system. I'm about to do this, and possibly use MWC, alternating between the two.

What have you written so far? I'm about to write a Top Ten or something like that listing for Transcendence, and possibly adding support for other BBSes out there.

Reminds me... Is the author of FoReM ST still around? How about the source code?

I've been reading through the 500+ page tome of the MWC manual, and whoa, it's quite a good read. I've been seeing the K&R books, and located the newer books at the local bookstore, and they're a little on the thin side, and are quite expensive, about $35-40. Also have C For Dummies, which gave me ideas and more insight, as well as a few others. I'll hit the local bookstores and see if I can locate that old version of K&R. Just do a Yahoo search under programming languages, and pick the one that has the category of C/C++.

: The only atari reference book I know of which is still in print is the
: compendium, reputed to be extremely comprehensive.

I believe Toad has this. I have the catalog in front of me, but can't find the book, though I have the CD ROM. It's a little useless without the book. They do have the Atari ST Tips & Tricks, and I have the Graphics & Sound book. Bravo Sierra had something the last time I was on there, so I'll be checking around for who has what again. I did do some searches while at the MIST fest in Indy, and I only wish they had it more than once a year.

I can handle moderation - either manually or automatically. That's the
easy part. Getting the RFD accepted and passing the CFV is tough.

I don't believe so ... at least I've never heard of it.

> Also, if that vector has already been claimed by something, how do I
> detect it, and what other TRAP vectors are available for me?

You shouldn't care about that ... hopefully you are passing some kind of
magic cookie to the interface that no-one else will pick :-) You should
of course use XBRA to chain your trap handler to any others that may have
been installed before.

But I think it would be less risky to change your TSR into a library of
functions that you could include as required in your apps.

Kermit probbaly already comes with a makefile. A few changes in the make
file like changing cc to lcc or $(CC) and the CFLAGS,LDFLAGS macros and
it will probably do everything. If I get a module that cascades messages
I handle the file with the same options in the IDE until they are fixed
and return to make.

I have compiled berkely pd yacc and flex 2.5.2, for example, with the
supplied makefiles and minor tweaks if any. Lattice although ansi will
compile K&R code.

>
> Any thoughts?

I have a proposal all written up. It was already shot down in flames
after being submitted to the group mentors, but I am more than willing
to let someone else have the text to modify as they see fit.

Getting 100 votes is the toughest part - but I think it's likely to be a
lot easier now than it was before I brought the subject up in the entire
comp.sys.atari.* tree. I suggest a "straw" vote - who wants to be the
vote-taker? We will probably want to take a straw vote on each of the
following points:

Should comp.binaries.atari (all systems) be created?
Should comp.binaries.atari (all systems) be moderated?
Should comp.binaries.atari.8bit be created?
Should comp.binaries.atari.8bit be moderated?
Should comp.binaries.atari.st be created?
Should comp.binaries.atari.st be moderated?

I suggest that, if we can find a vote-taker, and if we can garner 100 or
more votes in favor of any of the above "straw" proposals, that we then
submit the formal RFD and try for the group. I'd also recommend a .d
group (discussion) be part of the proposal for each binary group
desired, so as to keep binaries and discussion seperated (in
consideration of those who'd like to discuss the matter but don't have
selective download ability).

> I need the ability to multitask GEM programs, so, yes, I tried to use
> MultiTOS.

MultiTOS is one of the most horrible programs available for MiNT. It is slow and insecure. Actually my Falcon with MultiTOS is slower than my old ST with Single Tos (in my feeling). I improved the priorities for the several Processes and at least got reasonable speed.

Tyhe biggest Problem with Multitos is that it won't rum with memory protection. This would at least save the programs from getting corrupted by Multitos.

> I can't say I'm terribly impressed with the speed, and since
> I can't keep it running long enough to tweak it, I don't imagine I ever
> will be.

Better try N.AES. This seems to be a lot more secure, but still won't run with Memory Protection.It is a lot faster then Multitos, and possibly improving the priorities may improve the whole performance as well.

There are Beta Versions of several free AES Clones as well: XaAES and oAESis. Both of them are definately faster than Multitos (that does not seem to be too difficult) and at least XaAES runs AFAIK with Memory Protection.

Gem Multitasking with MiNT is reasonable, as long as you don't use Multitos.

Johan Klockars (d8klojo@dtek.chalmers.se) wrote:

: Any book that says it teaches C programming should hopefully do that.
: If the book is reasonably good, it shouldn't matter much if it happens
: to be named 'C programming with SuperC v 4.5.2a for the MegaMic III/2'.
: ANSI C is (more or less) machine independent.

Remember you gotta deal with books that have errors in it. There's comp.lang.c and comp.lang.c.moderated that have been talking about books, and the moderated group has mention of what books have errors, no matter how glaring. My only complaint about the books is how expensive they are. I've seen some that I'd like to buy, but they're overpriced, like about $30+, and one I'd seen was about $50.

: If you're talking about Atari specific things like GEM etc, that has next
: to nothing to do with C, but even then the differences are relatively
: minor.

That's what the good Professor was asking. However, if you're going to be using AES and VDI, and some others, then you will have to keep it on the Atari ST side. Converting it to IBM format, well, it's harder.

: The MGIFv5 sources are somewhere around 700kbyte (excluding all libraries)
: and compiles fine under GCC, Lattice and TurboC/PureC (I've never tried
: them under any other) with very few '#ifdef' modifications.

I'm gonna install the MiNT OS later on, and use that while I run gcc. I merely have to find the installation disks, which I've seen 9 of them. I have the older version, but want the newer version. What exactly is this MGIFv5 thing?

: A couple of data structures used by the AES and VDI (and I recall one from
: GEMDOS) have somewhat differently named components under the three
: compilers for some reason, but that isn't difficult to find or handle.

Hmm... Interesting. I'll have to check the bindings for Prospero C and see how it compares with MWC. Someone's about to send me a Laser C book, so I'll read through that once I get it.

: I remember fetching some rather good AES/VDI documentation from
: atari.archive several years ago, but I can't recall the names(s).

I'll need to run onto there and do some searches, but will have to download the index. There's some other Web sites, like one on Rich Tietjens', that has some links. I don't have the link to his site handy with me, but if you read any of his messages, you'll find it.

I have seen compiled Java Programs on a Sun and immediately fell
asleep...
It is really very slow. Surely Interpreting the language directly would
be even slower, but this does'n make it better.

> Downside: I have reports that Java requires _enormous_ amounts of memory
> to run. Can someone confirm or deny that? Reports I'm hearing are on the

Well, it does with Windows. I can't guess what ammount of Memory would
be needed on a Computer (not a Quick Toy (=PC)), but compared to the
usual difference in Memory consumptions of equal Programs on an Atari
and a PC, I guess, that 4MB should be enough on a Atari.

2840. 320 x 240 on Falcon?

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-19 00:00:00 UTC
From: uq086@freenet.Victoria.BC.CA
Message-ID: <Dut5w9.ApE@freenet.victoria.bc.ca>
Source record: 9383

Does anyone know what the proper graphics mode settings are to get a resolution of 320x240 on a Falcon? I know how to get 320x480 and I assumed by turning 'double - line' on it would become 320x240 but it turns out to be 320x200. Overscan gets the 240 but increases the 320 which is no good because I want the 1:3 aspect ratio. Any suggestions?

Nicholas

> well.

As long as I can't get either oAESis or xaAES to work with MiNT, I am
not going to spend any money for a completely untried AES replacement.
If it came with a complete, guaranteed to work MiNT package that would
be different.

> There are Beta Versions of several free AES Clones as well: XaAES and
> oAESis. Both of them are definately faster than Multitos (that does not
> seem to be too difficult) and at least XaAES runs AFAIK with Memory
> Protection.

But memory protection is not available on a 68000. And since I can't
afford a Falcon or TT (not right now, at least), it measn I'm not going
to have memory protection.

I did get the MINT030 binaries, and strangely enough, that works
reasonably well and is fairly stable. I need to study up and figure out
how to adjust the niceness properly (ALERT.ACC was burning 25% of my CPU
time and doing nothing at all as far as I could see), and I also need to
figure out how to make MiNT recognize that my serial ports are capable
of 115200 (it won't exceed 19200 on Serial2, which is simply stupid,
IMHO), but once those are doen, I think I can tolerate the slowness.
It's really not too bad with NVDI working (version 2.01, in case that
matters). The replacement file selector that's in GEM.SYS is almost as
good as Little Green FS, so there's about 30k saved anyhow.

I'd check who owns the rights now - but it would be nice to get some
sources. My particular need is for the command shell sources because
pipes and redirection don't work under MagiC. :-(

If you find out anything please let me know. :-))

There might be some hope. While they were in business they were very
supportive. I once sent them a bug report on 3.0.5 crashing which they
could not reproduce - they sent me a free 3.0.9 anyway. :-)

I know. However, I would like to hear from others out there, especially Rich Tietjens about this. There's some stuff in there, though I've not looked at the files on the disks, that seem to require a manual, about the switches that the support programs use. Plus, the main manual is about 740 pages long, including the appendix, and so on. I'm not sure if I'm going to be the one to type all that in! :-) I did hear some time ago, someone did type in the entire GFA Basic manual, though I'm not sure what version. Yow. Lotta typing. There's an ST Format disk that was released a few years ago that had a GFA Special, and put GFA Basic 3.5, GFA Assembler, and GFA Raytrace on it. Shall I post this, now that I heard STF is no more after they release their final issue?

I've not heard anyone reply to my question about Matthew Singer, author of FoReM XE, FoReM ST, and a few other versions of FoReM. Is the source code for the ST still around? I ask, as I want to see how it was written, as it helps to have a few examples of BBSes written in C, if this was.

: As always, those of us who were too slow to get the lates updates before
: the company disappeared would be thankful for them now.

Like I said before, I picked this up at the MIST AtariFest in Indianapolis, together with a few other packages. When exactly did MWC go out of business? How good is Lattice C over MWC?

: Let us know if you do put them on-line.

I may do so only with the blessing of other people. If I get a lot of people saying they want me to do so, I will. I don't wish to lose my account on my ISP over this.

Thanks for the response. I didn't think I'd get one, as most of the people
who post programmer-ish stuff in c.s.a.p or c.s.a.s.t seem to be app
programmers in Basic and C/C++. But I could be wrong in my appraisal of
those groups.

An early hacker-ish "guide to programming the ST" (circa 1986-ish)
published by Abacus (?) used Trap #3 for something - the local user group
has the book in it's library available for members to borrow.

> > Also, if that vector has already been claimed by something, how do I
> > detect it, and what other TRAP vectors are available for me?

> You shouldn't care about that ... hopefully you are passing some kind of
> magic cookie to the interface that no-one else will pick :-) You should
> of course use XBRA to chain your trap handler to any others that may have
> been installed before.

It installs a 'TLBX' cookie in the cookie Jar (or, if necessary, creates a
jar capable of holding 64-cookies first)

I already check that the params passed are correct, as well as the calling
protocol (which requires certain magic values to be placed in CPU
registers). At present, if something is wrong, the disambiguator will

return a null result to the caller. (That is less than ideal, however. Version 2 will improve that with a much better and somewhat faster disambiguator and dispatcher, along with a more robust calling mechanism)

Now where did I put my copy of the Compendium - I know it had some XBRA docs hidden in it...

> But I think it would be less risky to change your TSR into a library of
> functions that you could include as required in your apps.

True.

But if those ~12k of functions in the TSR are included in every program, it adds bulk to the apps.

And when one is running in a multitasking environment, where perhaps 10 different apps using those funcs are running, that means perhaps 120k of RAM will be used.

Assuming 15 functions in the TSR (I haven't counted them), each of 800-ish bytes, that totals 12000 bytes of code resident. (the remaining 3-4000 being data/stack)

Therefore, a 40-odd byte interface in each of those 10 apps to each (potentially) 800+ byte function in the TSR is more memory efficient. (40x15x10=6000 bytes in the apps, plus the 16k TSR equals 22k. 800x15x10=120000, so 120000/22000 or nearly 5.5 times more memory consumed is the functions were statically linked to each app)

And of course, if a bug is found, replacing the TSR will fix all apps simultaneously, and only a 16k TSR needs to be shipped, rather than multiple megabytes of apps - assuming the bug wasn't in the interface function)

BTW: For those who are interested - I am currently extending it to allow the boot-time loading of external modules (such as graphics converters, disc editors, and so forth) as extensions that can be used by all loaded apps. (It works, but is a little hairy at times - my implementation was a bit rushed and hence poorer than it could be) It's almost like DLLs in Widows, but not quite as dynamic.

Thanks again for your response. I'll keep your ideas in mind next time I'm editing it.

: pipes and redirection don't work under MagiC. :-(

Do so, if you can. I was pretty much out of the ST and Atari loop for several years, like about 1988-1992. Lotta stuff to miss. I still do have many of my magazines, both 8bit and ST, that I can check through, though I'll probably start out with the year 1988 or 1989, from when I've heard it went under or something. I'm still finding out about things that I missed from time to time, though I'd heard about the MIST fest every now and then. However, one slight bonus I have is that in my MWC manual, I have an 800 number. 1-800-MWC-1700. This big tome is quite surprisingly clear of other writing, other than the 312 number in Chicago, and the 800 number. Also included with the disks and the thick manual are two other manuals, the Resource Editor and csd C Source Debugger, all clear of any writing, and in very good shape. I'm gonna spend a little time checking what's on the floppies, though I seem to be missing the first two disks of the update of the csd debugger.

I've not played with MagiC yet. Right now, some of my time is spent learning the language, and reading the sources. However, I have been looking for a command resource 'card' for gcc. I don't mean the '-' commands, but rather, the C language commands it uses.

: I found it rather expensive here in the UK as well so I never bought a
: copy either. Trouble is, you can't get the old version in libraries
: any more.

It can be expensive, yes, but if you can find places that sell books for real cheap, grab them. I've located a few of them for $5 USD or less at times, and they're still in good condition, though they're for the IBM systems, but the examples are good.

: >I'll be checking around for who has what again. I did do some searches

There are some separate `make' utilities around (check out
atari.archive.umich.edu), of which the best (I guess) is the GNU make,
but I'm not sure whether that one works without MiNT.
You can easily set them up to use your C compiler.

Good luck,

2856. GCC 2.7.0 for TOS/MiNT

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-21 00:00:00 UTC
From: gdg7@vision.hrz.uni-giessen.de
Message-ID: <4stbu1$okq@c4.hrz.uni-giessen.de>
Source record: 9299

Hi everybody!
I'm searching for GCC 2.7.0 for MiNT/TOS somewhere in the net. There is a commercialized version (CD-ROM for a heavy 30-40 buck$) but I'm not interested in paying a lot of money for some kind of freeware!!!

The reason why I'm looking for GCC in this version is that GCC 2.3.3/2.5.8/2.6.1 for MiNT/TOS has serious bugs avoiding to compile programs such as mkisofs without errors (there are no warnings but the programs do not work due to some compiler errors!).

Regards,
Torsten

P.S. Please contact me by EMail!

2857. Help! C expert with amiga and atari savvy

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-21 00:00:00 UTC
From: bdc2@po.CWRU.Edu
Message-ID: <4su1o8$mc2@madeline.INS.CWRU.Edu>
Source record: 9300

Help! You might have seen earlier post by me in this area. I am trying
to update Kermit, without enough knowledge of *C*.
I have MWC, the program the Atari parts were written for. So far,
I have gotten the latest version (192 beta) to compile and run, at least with
all of the capabilities of the 3-year old (189) version. That version
was VERY limited, and had no DIAL or SCRIPT capabilities. These were
not included because the Atari has no signal/alarm capabilities.
Now there is a version for the MAC and for the Amiga, that have the
full system enabled. The MAC parts are very complicated, but the Amiga
version LOOKS simple. The main problem right now is, There are apparently some
system calls that I can't figure out. I need a VOLUNTEER to help me
figure out how to translate the Amiga calls to Atari, so the MWC can figure
them out.
Anyone who helps will of course be duly acknowleged. I
have the sources for both versions.
Can anyone help????

> Has anyone played with Lattice C, version 5.60? How good is it?

Quite good - much better than 5.06.02 that I owned earlier, however it does have a few features that piss me off - especially under MultiTOS.

And, if you are using MultiTOS, you can't change to a different app until compilation is finished. You can't even call a DA or some other innocuous util. (I often get ideas half way through a 25-minute build on my TT, and cannot test them out without aborting the build.)

And the way it seems to love to hang my machine when it has two megs of RAM consumed and I try to open a fourth or fifth window - it requires a "switch it off" cold boot - the whols system has hung. It's not that I have run out of RAM. Far from it - I have at least 8-10 megs of TT RAM free at that point.

(I run Mint 1.12 with memory protection 'on')

I'd have liked a way to mark a window as "read only", so version 2.17 of my masterpiece from three weeks ago won't be accidentally altered instead of the current version.

(Sorry. I just guess I am in a bitchy mood. it really is a good product if you can spare 3-5 megs of hard drive for it. It's much faster than version 5.0)

2861. Keyboard system vectors

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-22 00:00:00 UTC
From: borst@cs.utwente.nl
Message-ID: <4sveef$4ao@pandora.cs.utwente.nl>
Source record: 9304
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

Hello,

I am writing driver software for a PC keyboard attached to the
MIDI ACIA of the ST. The driver converts scancodes from the PC
keyboard to equivalent Atari scancodes and then jumps to a
subroutine in the ST ROM that handles this scancode and puts
codes in the GEMDOS keyboard input buffer.

The problem now is how to find the address of this routine in ROM.
The Xbios call Kbdvbase gives vectors to routines to handle about
every type of messages from the keyboard, except for plain scancodes.

I found out that in TOS 2.06 the longword immediately before the
KBDVBASE structure is a vector to this routine. To make my driver
work for all TOS versions, I want to know which versions of TOS
use this undocumented vector. Does anybody know this?
And does anybody know at which address the routine is located for
the TOS versions that don't have this vector?

I know that jumping straight into the OS using an undocumented is
bad programming and highly non-portable, but I want to make a version
of the driver that does this because it then has the full Atari keyboard
functionality, including CNTRL+ALT+DELETE, ALT+HELP, ALT+(SHIFT)+UP/DOWN/
LEFT/RIGHT, ALT+ascii code etc. The portable version of the driver will
probably only contain code for 'normal' keystrokes.

Thanks,
Pim.

>Rich Tietjens about this.

I;m no lawyer, but my opinion is: You should make a legitimate effort to contact the last-known copyright holder(s); write any snail address you have, perform a search on both the company name and program name on AltaVista and Switchboard, post a query in several of the business newsgroups. If, after 30 days, you are unable to find/contact the copyright holders, place a disclaimer in the archive (which I assume you will be creating) stating exactly what methods you have used to try to contact the copyright holder and what results, if any you have had, and that you will immediately withdraw the archive from general distribution if anyone with a legitimate claim will contact you at (your email address and your snail address).

Of course, if you are able to contact the owner, request their permission to distribute. If they refuse, you should not post the exact text they used to do so, (of course, if all they say is "no," that will be next to impossible to avoid), but you should post that information - and wher to contact them - here, and any other place you feel it would be apropos. If they agree, again add a disclaimer as above with current contact information.

>There's some stuff in there, though I've not
>looked at the files on the disks, that seem to require a manual, about the

>Raytrace on it. Shall I post this, now that I heard STF is no more after
>they release their final issue?

Magazines usually don't object to reposts after a year or so, but again, contact the publisher. It's plain courtesy, if nothing else - and if they plan to release a compendium, they may tell you so and you can start garnering interested potential customers for them.

>I've not heard anyone reply to my question about Matthew Singer, author of
>FoReM XE, FoReM ST, and a few other versions of FoReM. Is the source code
>for the ST still around? I ask, as I want to see how it was written, as it
>helps to have a few examples of BBSes written in C, if this was.

You might try contacting the "authors" of Turbo BBS, as Matt stated on many occasions that they had stolen his source code outright. I haven't heard from Matt in many a blue moon <G> and I think he's moved on to something else.

>: Let us know if you do put them on-line.
>
>I may do so only with the blessing of other people. If I get a lot of
>people saying they want me to do so, I will. I don't wish to lose my
>account on my ISP over this.

Given the foggy issue of copyright, it's best to try as I outlined above. I doubt that anyone except Prodigy or CompuServe (maybe AOL) would pull your account after you made an honest effort to contact the owner and failed.

BTW, in case onyone is interested, I contacted Joe Blenkle (author of the doorgame "Cows!") and he's alive and well, although without an ST. I don't know if he can still generate registered versions of Cows! but it's a fun game - well worth a trip to AltaVista to find Joe if you have a BBS that needs a wacky door.

Etc.

Well. You don't have to use a trap at all. Just place a function pointer
into the cookie and call the functions through that interface. See
the XHDI spec as an example (http://wwwmath.uni-muenster.de/~reschke).

Very annoying, all right. I'm trying to gather more info on writing a BBS program, and have some stuff, but I don't quite get how the info is picked up from the modem. Still am reading some of this stuff...

It would be nice to be able to use the computer at the same time a user is on the board. As you can see, I'm just starting out. However, what with my previous programming with Basic, Cobol, and some Pascal, it's made easier.

: (Sorry. I just guess I am in a bitchy mood. it really is a good product
: if you can spare 3-5 megs of hard drive for it. It's much faster than
: version 5.0)

That much space is easily spared if you got a gig drive like I do...

However, someone mentioned in an email to me that it puts out code that's not exactly fast. What's up with this?

Thanks for the info.

Thankfully I don't use TRAP #6 (address VBR+$18 on 68010+ machines,
$00000018 on 68000 systems).

BTW: Are TDI Modula-2 and RTX comaptible in their implementation of Trap #6?
(Just curious)

I do believe it is based on a project from a German computer magazine. It
is now available as a commercial project from Toad (http://www.toad.net)
in the US and (IIRC) System Solutions in the UK. I don't know who the
Finnish distributors are. Toad's Web page does have a reasonably good
description of it.

It wasn't too hard to get MWC working under MagiC. The MSH will run
happily in a VT52 window, although in the end I found it better to put
the environmental vars into MAGX.INF and remove them from PROFILE. Now
MWC will run run happily from within MSH, by dragging a source to my
CC.PRG icon, or better still, I can just hit CTRL-SHIFT-M and MAKE
will be invoked on which ever window is active. If it wasn't for the
broken file redirection, it would be perfect!

Announcing Peter's page of Atari Sound and Midi programs and resources.

Midi and Sound

Links to various Midi utilities, algorithmic music, sound editing and
creation. I have searched around for the most useful, interesting
programs and resources and this page is the result. No pictures, just
the facts :)

Please note that the page is aimed at ST and not Falcon , mainly because
I dont have a Falcon.
Any comments and further leads would be appreciated..

That's my starting point, since my manual was dated 1988, and there's the references to it being not released any more for the STs a year or two after that. That's your starting point, on all ST mags, maybe the one that went out here in the States a few years ago. They were always reporting on some of the very good stuff. My Chicago friend sent me a couple boxes loaded with these mags, so I'll be looking around there. If anyone has other references, let me know, better yet, post them!

: Is there any response from those telephone numbers these days?

Yep. My response to Rich will tell you about it.

: >what's on the floppies, though I seem to be missing the first two disks of

Since MagiC is copyrighted, and it's a little expensive for me, I'll wait a bit til I can afford it. I've seen the newer GEMulator that doesn't require the hardware card to work. It's nice. I'll be installing MWC soon, to play around with it to see what to expect.

I see Toad is still selling Prospero C. Wonder if I can update it... Gonna try soon on that one!

For pure ASCII files, you don't need any conversion. The special
characters (umlauts etc.) might get mangled up. You can't convert the
Hebrew characters, because MSDOS doesn't have them.

Check out the IdeaList package (probably on hensa or umich archives). There
is a helper program called BLINEX that will convert them for you.

2884. SozobonX library fns.

Newsgroup: comp.sys.atari.programmer
Date: 1996-07-24 00:00:00 UTC
From: thopman@uoguelph.ca
Message-ID: <4t5kmb$9cg@ccshst05.uoguelph.ca>
Source record: 9327

I have a couple of questions about the SozobonX libraries. I was able to install SozobonX system, get it running, and compile my C course projects with it, so everything should be set up correctly. However, there are a couple of "standard" functions, namely atof() and strtod() that don't work. Trying to use atof() make the linker claim that it can't find the symbol _atof, which is strange, because it's in the archive libc.a.
A similar message results when I try to use strtod(), except strtod is in utils.a (or something similar) rather than libc.a. Dearchiving the .o files stops the linker from complaining, but either I'm not using the functions correctly or something's wrong with them, since they're not working properly. I am aware that the double arithmetic in SozobonX isn't there (or is broken). Would a cast as float solve the problem? I didn't try that, since I really only wanted to convert strings to integers and ended up using atol().

That is easy. just format a Disk on your Dos Computer (to all: is this really necessary for disks?) and put the ASCII File from your Atari on it. Then carry the Disk to the Dos Computer and read the file (not you, let the DOS Computer do that. This is something even MSDos can do ;-). This should be all you need to do for this "conversion".

Christof

Rich Tietjens (RichardX_Tietjens@ccm.jf.intel.com) wrote:

: Remind me to get in touch with you about Baudot code (I want to write a TTD
: emulator for the Falcon).

TDD/TTY emulators are interesting. There's one already out on the net, so search under handicap archives. I do know that there's this exact archive out at oak.oakland.edu, and there's a program for the IBM systems. The Baudot code I don't know, since I don't have the specs with me. However, I do own a TTY, and it gets used a lot. You should listen to the tones coming from it, as each letter is different. Due to the federal requirements of the ADA (Americans w/ Disabilities Act passed in 1990/91), all states were required to provide the Relay Services, so each state has its own number.

On my homepage is a link to the Deaf WWW and a link to learning sign language, both of which can give you a starting point, as well as using deaf as a keyword for a Yahoo search.

Aha... Reminds me. I tried the 800 number using the Relay. Twice. Both times there was a male answering the phone. Both times he said he didn't have time, and hung up, giving the operator no time to reply. How rude. Maybe someone else can try if I keep having trouble with him?

: There is the misc.business hierarchy, and alt.business - I'd go with misc
: first, because alt tends towards spam, as we all know. %^(

Right, I know about spam... Most of what I read are in the alt.* groups. Spamming galore. I was considering crossposting my message here and there, so we get maximum coverage, and both groups chat freely. However, we may not need to, from what I've found. More below.

: >of the files on here and around. A CD ROM of their best sounds good.
:
: I'd buy that.

heh... One buyer already! I've got a number of them, and it'll take time to really go through it. A CD burner or whatever would be a little expensive, but I can always send it out to someone to do it for me. What's the address of the editors of STF? Can someone bring Frank Charlton here, and see what he says about this?

As for the international copyright thing, that effort will be made, but I'm not the only one to be doing this, as I'd like others to help out as well. How about it? We're mostly talking about companies that are no longer, and the owners can still prosecute for illegal distribution. Finding the owners is a little difficult at times.

: I don't run Turbo and don't have much more than that to give you. It's no
: longer supported, either AFAIK.

That's what I figured. Neither are supported at the present time. However, I have found a number of Matthew Singers, and he's still at the Framingham, Massachusetts, address, or so it seems, from using Switchboard. AltaVista revealed a little more. I have his namesakes, or him, at Case Western Reserve University as a student, and at fau.edu in Florida, from the 8bit FAQ. A bit far from his Massachusetts home. Email has been sent, so I should have a reply after you read this, hopefully.

: This is definitely off the wall. Bits of it are off the planet!

Cows! it is, I'll nab, and see how it goes. And I thought my medieval assassin game was a little wild what with the way the prompts and responses are at times.

: >Off to AltaVista it is for me to do some checks. [Another One Bites The
: >Dust in the background - hehe] Gonna do it anyway. [grin]
:
: Good luck!

OK... Lots of things I've found, plus a couple emails waiting for me when I logged in today. One was on a question of Singer, like I said above. The second was on MWC. He mentioned an address, 60 Revere Drive, Northbrook, IL, 60062, 847-291-6700. The company went under according to an archived message I found, in February of 1995, though the company became inactive for the last several years. However, there's mention of Coherent, a Unix operating system clone of sorts, if I understand it right. Many, or at least some, of the former employees of MWC can be found on comp.os.coherent, and our Professor Boris has been talking to some of them on there. There's a few text files I found, that might be of interest, if anyone wants me to post them. All this was in a couple hours of searches.

That last mail also mentions of people attempting to get in contact with the owners of the MWC copyright, and not having much luck. It's merely one person doing all this. I'd rather have help doing this if I have trouble locating certain things.

True. But if you are using a computer that came with a 48 meg drive (as my TT used to until late last year), it can be a bit tight.

The 5.60 installer still puts a lot more stuff on the hard drive than needed (one can, when one is familiar with Lattice, delete the unneeeded, so Lattice only takes perhaps a meg or so)

> However, someone mentioned in an email to me that it puts out code that's
> not exactly fast. What's up with this?

Compilation options can be the biggie.

The "debug with register flushing" compilation mode is guarranteed to slow things down - especially if you write code that uses tight loops (an interrupt handler grabbing data "live", for example).

This is a problem with all compiled languages, especially when the compiler gets a different idea of what the code does to what you want it to do.

But you can also run the app through the supplied optimiser (an optional phase in the compile process) to speed it up by 10% (I believe that the manual gives that figure - I have never actually got that much of a speedup from it)

But even then it isn't the fastest.

If you are familiar with 68k assembler, you can speed up the "wading through treacle while pulling a fully laden logging truck" slow bits by writing in assembly language. (Or engage the assistance of a 68k assembler programmer)

The enclosed debugger, MON is good, but will not co-operate in MultiTOS. I've emailed Hisoft, and got a less than helpful response ("That's how we wrote it, and it's just a fact of life that it acts that way in the presence of MultiTOS")

Lattice is still better than Megamax C, although not as fast as Laser C (both in compilation and code produced). But it beats Laser in being able to run on my TT, and in being able to output '030 code.

There`s a GNU tool out there, called recode that handles all sorts of
character-set specific conversions of texts.

It also handles the Atari character-set and makes it possible to convert
the first to almost any other machines` alphabet and vice versa.

The character sets comprise lots of ISO sets, ASCII, several PC and Mac
sets etc. It is available (binary) at:
ftp://ftp.uni-paderborn.de/ataritools/util/recode34.zip

Or as source code at any server that got a gnu directory.

I've never had any copy of csd. I found the undocumented (in the
lexicon) -VCSD switch in CC.PRG by accident one day when messing with
a disk sector editor. The level of comments generated along with -S
meant I could trace bugs back to source lines anyway.

:
: I wish I knew what in MagiC causes MSH to have broken pipes and
: redirection!

There's mention that TOS can somehow be decompiled, which is how the
German people came up with MagiC, fixing a lot of bugs in there. I'd love
to see the original code.

: It might be possible. I've got Prospero Pascal and if I ever had
: reason to use it any more, I reckon it's flexible enough to add new

I was doing some checks on AltaVista and a few others, so I'll see what
else I can find. Some things exist with MWC, while not so with Prospero.

Reminds me... I was doing some heavy checking with the search engines and
then some. Found a few more people who were running Forem ST, and so on,
and got a couple messages, one about possibly where I can find the other
person that Matt had given the source to Forem, and the person who may be
the copyright owner of MWC, and suggested reading comp.os.coherent.

I'm on my way...

Great! Let me know what you may plan on doing with it.

: Rude, indeed. What's the number? email me here at Intel and I'll give him
: buzz.

Just emailed you on this... Let me know what you find.

Reminds me. I just got a reply from Matt Singer. One of two emails to two Singers netted him, in a pretty fast response, though short. Maybe someone else can help out with some things he said...

He said that he had given the code to a couple people, but who, he can't remember. Anyone know anything on this? He also talked about the TBBS program, a clone of his Forem ST program, and said that the people hailed from Canada. He'd rather forget about them, probably an interesting nightmare that happened. Finally, he mentioned that there was someone who edited his ST-Term to PD-Term, and posted it all over. I'm going to check back with him later, to see if he still has his old ST stuff around.

I don't have much info on the Turbo BBS program, but if someone used it, and still has it somewhere, let me know. I'll be checking with AltaVista, but I think the IBM systems have something similar.

Message-ID: <Dv48DE.4M9@freenet.victoria.bc.ca>
Source record: 9339

Does anyone know the correct number of words per line in 320 x 200 16-bit color mode on the Falcon? Logic says 320(pixels per line) * 1(16 bit color equals 2 bytes or 1 word) for a total of 320 words per line. Is this wrong? I ask because if I fill the first 320 words of screen memory 2 lines are drawn. It must be an easy answer but I'm stumped.

I originally purchased 3.0.5 - there was no csd with it. MWC sent me
3.0.9 after I wrote pointing out a bug. If 3.0.9 came with csd on a
disk of its own then I suppose I could have missed out on it, not
having purchased 3.0.9 directly.

>There's mention that TOS can somehow be decompiled, which is how the

I did a tiny bit of investigating of the broken shell. The bug is
always the same. Even a simple "ls > z" ...

r_look.c: 52: assert(p) failed.
waiting for newline ...

[then MSH quits]

This appears to be down to Fforce() and Fdup(), although I'm not
certain of that - I'd have to do some test code to refresh my memory.
It might just have been MWC's dup() and dup2().

MWC is easy enough to upgrade for newer OS functions, especially TOS
ones. Gem ones are a little more longwinded but still easy.

OK... I checked my end closely. Apparently, when you bought MWC, you got the software, thick manual, and Resource Editor manual. Seems my package had csd included, when the previous owner bought it separately. Someone says, thought it might have been you, that there's something comparable, the -VCSD switch. My Release Notes that came with the package I have mentions this. I quote from it; "Include csd debug information in the objects and executable." Sounds like you can use the debugger while in the cc program. There's also the db program, which is the assembler-level symbolic debugger.

: I did a tiny bit of investigating of the broken shell. The bug is
: always the same. Even a simple "ls > z" ...

How does this ls thing work? Do you have the unassembled code lying around? I'd like to see it.

: This appears to be down to Fforce() and Fdup(), although I'm not
: certain of that - I'd have to do some test code to refresh my memory.
: It might just have been MWC's dup() and dup2().

I keep forgetting... What does MSH stand for again? The Fforce and Fdup have something to do with file handles, which can easily have something to do with the infamous 40 folder bug. That's different than the dup and dup2, which have to do with file descriptors.

: MWC is easy enough to upgrade for newer OS functions, especially TOS
: ones. Gem ones are a little more longwinded but still easy.

Right. I've read through the manual about this, and the AES and GEM ones seem to be pretty easy, creating GEMboxes for alerts and so on. Haven't read up on the VDI one, as I'm on K right now, going through it page by page. Worth the time, though! I'm gonna need to look up more info in detail on GEMDOS, AES, and VDI programming, though someone mentioned some good places on the Web for them.

Also, there's going to be a new subject coming up about MWC emails. Don't let the subject confuse you. It's a message from me, that I've crossposted to here and comp.os.coherent, where some of the ex-employees of MWC lurk, from what others tell me. I'm hoping to get a good discussion going here, that's hopefully educational. Ye gods, the history I keep coming across!

I've got a bit of folded paper that's rapidly filling up with writing from my searches out there.

I've located still more people who may help out in locating those who wrote Forem ST (that is, the people that Matt gave the source code to), TurboBBS, and QuickBBS. All this is netting me several emails a day, plus I'm sending out others, other than my normal replies.

Cross-posted to: comp.os.coherent,comp.sys.atari.programmer

Robert Thelen (rthelen@uhc.com) wrote:

: Does MWC still exist? What products do they produce/market? Can someone
: tell me how to post a response without having to pad with extra character so
: my response is longer than the original message to which I am responding?

MWC went out of business in early 1995, from the results of my intensive use of the various search engines out there. From what I've been told by various people, the ex-employees hang out here and mostly lurk.

I'm here for a few reasons. Mark Williams C was released for the Atari ST systems for a short time, then for the next several years, up to the passing of the company, Mark Williams Company was dormant. If someone can check, what was the last release of the Atari ST version of the Mark Williams C package? It's 3.0.9 from what I've heard. Is Bob Shwatz still around? How do I contact him? In my manual, there's an 800 number, 1-800-692-1700, that's still in use. I tried calling through a TTY relay service, since I'm deaf, but the person who answered was incredibly rude to the operator and I, refusing to even let us get in a word edgewise before unceremoniously hanging up on us, saying he had no time. Another fellow tried calling, but seems he had no better luck, with the guy on the other end sounding weird, and he was unable to understand much of the conversation. Now, who *IS* the present owner of this number?

Finally, this message is being posted to comp.sys.atari.programmer and comp.os.coherent, since the people in both groups will want to see the answers posted, as there's a discussion about this on the c.s.a.p group.

Hi all GFA programmers!

I am currently updating my website, and want to include a page for GFA programmers, since I have found no such thing on the web. I already have a page for Face Value (GFA-tool) and a general Atari page...

I need your help. I want to collect all patches, utilities etc, so people can download (or preferably pointers to FTP...). I know about A La Card, M_TUNF, GFA_PATCH (1.07?), but I am sure there is more (a FAQ, f.ex).

Preferably in english, but I have resigned to the fact that most of the good stuff is in german, so that is ok, too. Just make sure to explain what it is (my german is a bit rusty...:-).

Please e-mail: vegard@interlink.no

Much the same as the unix ls command.

>Do you have the unassembled code lying around? I'd like to see it.

I'm afraid not, ls is wired into the MWC command shell. I'm sure you
could get a good idea of its functions by looking at unix source.

>descriptors.

MagiC does not suffer from the 40 folder bug. One thing I forgot to
mention is that the shell gets as far as creating the redirected file.

As it is zero length then the shell obviously packed up before it got
to issuing an Fclose().

>: MWC is easy enough to upgrade for newer OS functions, especially TOS

>good places on the Web for them.

Here's a section showing how I added some newer Gem functions. Boring,
but perfectly possible. It could be simplified further with the MWC
library code sources because crystal() could be used I guess.

It is definitely 320 words per line in 320x200x16.

You may have by accident(!?) set the linedoubling bit, which also works in
RGB-mode and gives a resolution of 320x100 but it still looks like 200
lines.

Are you sure you don't move longword or something else which makes you
move twice as much??

Any help?? If not, it's quite a weird computer you have! :)

(snip snip snip)

Excellent! This will save on mailing and acquisition costs definitely!
Unfortunately I only have 2 or three issues left in my collection (they
went the way of my 800xl - disappeared under mysterious circumstances)
but this was one of the best, most focussed magazines ever. One thing
you might add is a link to the Antic disk archive at ftp.clark.net,
under /pub/atari/mag/antic/. Maybe you can even place a link to the
appropriate file in articles instead of giving the computer listing.
I just checked the archive and the files are under directories corres-
ponding to each issue, that is the disks are not just one zip'd blob
file each.

Oh, and can you post the permission letter to the newsgroup, and have
the info placed into the appropriate FAQs (especially newbie). That
may lessen the confusion later on and the charges of copywrite infringe-
ment from people who don't follow this thread.

I am happy to announce the launch of the Digital Antic Project. Antic magazine was the premiere magazine devoted to 8-bit Atari computers. Antic, like the 8-bit Atari, has been forgotten by all but a small minority...

The Digital Antic Project is a small crusade to put all of the old issues of Antic (and eventually its sister magazine, STart) on the Internet. I have received permission from the publisher of Antic to make the material available on the Internet for free.

The site currently features the complete text of the first two issues, as well as cover art and memorable ads from the magazine. More material will be added as time permits -- faster if YOU volunteer to help by scanning, HTMLizing, or proofreading.

The site is at http://www.northcoast.com/savetz/antic/dap.html

Your comments, suggestions and help are welcome!

Current contents of the site include:

----- April 1982 - Vol.1 No. 1
Products in Depth - A survey of three word processors
Starting Line - Glossary for the novice
Systems Guide - Memory Map, part one
Pilot - Pilot your Atari
Tape Topics - Some help for cassette owners
In the Public Domain - Chicken
Forth Factory - Multi-tasking in Forth
Assembly Language - A keyboard mask
Editorial
Software Reviews
Useful Tricks - Assembler-editor cartridge
Looking at Books
Kids Korner
GTIA
What's in a Name? ANTIC and Atari
User Notes - how to tell if you have a GTIA chip

----- June 1982 - Vol.1 No. 2
Modems
Dialing For Data
Communications Software
Assembly Language - Move-it
Starting Line - Screen Editing

'Tari Talkers - Speech Synthesis Comparison
Tricks of the Trade - Game Program Techniques
Pilot Your Atari - Large Text
In the Public Domain - Death Star
Systems Guide - Memory Map
Pascal - A First Look
GTIA
Forth Factory
I/O Board
Inside Atari
When the Chips are Down
New Products
Looking At Books
Kids Korner

Cheers,
Kevin Savetz

I have all the Antic and STart issues w/ Antic, and thought about doing this myself. Unfortunately, My friend with a nice flatbed scanner is off to CA visiting a girl he met on IRC. <g> I will be glad to help when he returns. I had thought about digitizing every page until I found out how long that would take, and also how much free HD space I have compared to how much this would take. Also, I need some very good OCR software to come into my possesion, one that does fonts, text placement, line drawing, etc etc.. The package included with his scanner needed alot of help when we tried to ocr the table of contents page of one antic mag.

I would love to see a digital version of every Antic mag online, and catalogued to boot! Both text versions and the actual digitized page, large enough to be readable of course. Any other suggestions? (so far we are dreaming unless someone can donate server space(digitized pages of info get large fast.)

Rick

Reread the first part of the thread, we got server space covered
already...oops.... :)

What image dimensions do you want for the covers and ads? also, if we
were to digitize every page for _reading_, what image dimensions do we
want? All my mags are almost pristine in condition, provided enough
time I could put them all online, but are there other altruistic
individuals with both a scanner and a large collection of Antics (and
Analog!)?

Anyone know of a program that takes a digitized magazine page and
automatically html-izes it? Now that would be cool.

Rick

I will be doing that. Unfortunatly, the Antic disks didn't start until 1984, but the magazine started in 1982. So there are about 18 issues of diskless code. :(

>be different.

XaAES is still very much beta, so I don't very many people to get it
working. I have had a lot of trouble getting oAESis to work myself (it
varies from release to release though).

>> There are Beta Versions of several free AES Clones as well: XaAES and
>> oAESis. Both of them are definately faster than Multitos (that does not
>> seem to be too difficult) and at least XaAES runs AFAIK with Memory
>> Protection.

Actually, XaAES still (even on my personal version, not yet released)
has problems with memory protection that I've not managed to sort out
yet :(

>I did get the MINT030 binaries, and strangely enough, that works
>reasonably well and is fairly stable. I need to study up and figure out
>how to adjust the niceness properly (ALERT.ACC was burning 25% of my CPU

Use the PS_CPX in the Xcontrol panel. XaAES, oAESis and AES4.1 all
support launching apps with pre-set priorities (XaAES and oAESis go a
little further with their multi-process / multi-user support as well).

Craig.

Date: 1996-07-29 00:00:00 UTC
From: Mike Jackman <mickey@two-dogs.demon.co.uk>
Message-ID: <31FD01B8.69D6@two-dogs.demon.co.uk>
Source record: 9263

Does anyone know how I can insert characters into the Gem keyboard
buffer using Prospero C ?

Cheers, Mikey

Kevin, I still have an unpublished article for Antic or STart (I think it was
for Antic, it's on 5.25-inch) that I'd like to submit. Wil you add it if I
post it to you? If so, please email me your snail address and I'll pop it in
the Blue Box down at the corner.

A quick and easy way to add plain text in columns is to use the <pre> tag
(indicating preformatted text). Use the <H> tags for headlines, and
inline graphics, and the pages can look just like the original pages
without much storage overhead.

It's not true, if you know how to treat the optimizer.

>Compilation options can be the biggie.

Yes, and those aren't really very well explained in the Lattice C docs.

In the optimization dialog, only three of the options should be selected
to produce well optimized code. One of the four must be deselected (the
second IIRC) or things fall apart.
How's that for confusing?

Apart from that, the optimizer is very buggy.
Not that it produces incorrect code, but it fails to optimize for
incredibly strange reasons. It can actually produce worse code than you
get by turning it off completely!

I emailed HiSoft about the problems several years ago (before 5.60), but
they never did anything about it.

The most important thing to remember is that the optimizer _hates_
16 bit integers. Most optimization seems to be simply turned off when
those appears.

>But you can also run the app through the supplied optimiser (an optional
>phase in the compile process) to speed it up by 10% (I believe that the
>manual gives that figure - I have never actually got that much of a
>speedup from it)

The optimizer can give _very_ large speedups, like more than ten times.
Depending on what kind of code you write, you may also have next to no
speedup. And then there are the bugs I mentioned above...

On a real program (MGIF) I've gotten about five times speedup or so over
the unoptimized version for some functions.

By the way, someone wondered what MGIF was. I suggest you take a look at
my WWW page. See the .sig at the end.

>But even then it isn't the fastest.

Actually, it's the best I've found for some things, even beating GCC.
TurboC/PureC is a joke in comparison.

It would be interesting to hear what other compilers do about the
following short program I threw together yesterday:
(Please, note that the program is not supposed to do anything useful.
It's just a test of optimization performance).

```
#define ROWS 25
#define COLS 25

void main(void)
{
long i, j, k;
long array[ROWS][COLS];

for(i = 0; i < ROWS * COLS; i++)
*((long *)array + i) = 0;

k = COLS * ROWS;
for(i = 0; i < ROWS; i++)
for(j = 0; j < COLS; j++)
array[i][j] += i * k;
}
```

I will post my results from Lattice C, PureC and GCC soon (like tomorrow).

>The enclosed debugger, MON is good, but will not co-operate in MultiTOS.

How about that third part source level debugger (I forgot it's name)?
I've never tried it myself, since I use GCC about 99% of the time, but
wasn't it even FreeWare?

>Lattice is still better than Megamax C, although not as fast as Laser C
>(both in compilation and code produced). But it beats Laser in being able

I would be _extremely_ surprised if Laser C produced anywhere near the
same quality of code as Lattice C on the program above.
If those bugs hadn't prevented the optimization from working most of the
time it would have been a much more popular compiler.

TurboC/PureC are _very_ fast at compiling, but do next to no optimization
at all. They're rather good at register allocation, however, which means
that on simple code they can often seem to be very good optimizers.
The register passing of function arguments also helps a lot.

As you'll see when I post the code generated from the program above (or
if you try it yourselves), which may seem simple, TurboC/PureC are actually
quite pathetic.

I would love to help out on this project. I would be willing to HTML-ize text (as long as it can be scanned in and converted to text with some OCR previously). I think that articles should be done in HTML format, with illustrations as scanned-in pictures. I could even crop images to place in illustrations. Too bad I don't have convenient access to a flatbed color scanner. :(However, I have most Antic and Analog magazines.

This is a really good idea! Way to go!

: Much the same as the unix ls command.

I'd like to try doing this myself. Mind giving me a sequence of steps on what to use and where to do it to do this? Doing this command, the ls > z would be to send a listing of the files to a file.

: >Do you have the unassembled code lying around? I'd like to see it.
:
: I'm afraid not, ls is wired into the MWC command shell. I'm sure you
: could get a good idea of its functions by looking at unix source.

I've seen some Unix sources, but guess it's time for me to look into it some more. I'm about to install MiNT and GCC onto a 1.6 gig drive, as well as MWC, to do a bit of switching between the two. Since the 0.95 install of MiNT is on the Atari Compendium CD I picked up on when i was at the MIST AtariFest, I'll install it from there, then do installs on the subsequent installs til I get to 1.41 and patchlevel 46.

: >I keep forgetting... What does MSH stand for again?
:
: MicroSHell.

That's right... I was reading my manual, and realized it meant that. Still am a bit of distance from finishing up reading it.

Reminds me, I'm about to write a program of my own that does Top 10s of various places of the Transcendence BBS. Top 10 of posters, calls, uploads, downloads, as well as Bottom Ten. I'm going to be using the qsort command, and am wondering about sorting an array, without sorting just one column... I was considering a struct arrayname with several parts to it, namely, username, posts, calls, uploads, and downloads. I'll read the index file, counting the users already on, then make a subroutine to read them in, putting them into the array, and then sort.

: MagiC does not suffer from the 40 folder bug. One thing I forgot to
: mention is that the shell gets as far as creating the redirected file.
: As it is zero length then the shell obviously packed up before it got
: to issuing an Fclose().

It doesn't? Most interesting. I gotta get it sometime. So the shell just 'forgets' to close the file after creating it? Apparently there's no error checking if I'm understanding you right.

: Here's a section showing how I added some newer Gem functions. Boring,
: but perfectly possible. It could be simplified further with the MWC
: library code sources because crystal() could be used I guess.

Read it, but it looks more like assembler to me. I'm considering trying 68K after I learn it some more. I never really got into 6502 assembler when I was playing with my 8bit. However, if I wish to get a little more complex, I'll use GCC and its updated command listings.

: gemdos, bios and xbios functions are trivial - simply define a macro
: in the same manner as the relevent header file.

The compiler creates the headers for you, though all you need to do is write the actual coding yourself, according to the stuff I've been going through. There are some header files that you don't write, that I've seen that merely help out in writing your program. There's a QBBS.H file in the LazyBBS source code I've read through that's in the umich archives, that seems to be a QBBS style message base setup, though you have to be the one to write the actual message base. Shall I post this file?

: I saw it. Good luck!

Thank you. Now all I need to is find Bob Swartz, owner and president, if I'm understanding right, of Coherent and Mark Williams Company. I suspect he's in the Northbrook, IL area, about 30 minutes outside Chicago, and he could be in Chicago somewhere. So far, I've found no email address, neither have I found a snailmailing address, though I found an email address of coherent@vma.cc.nd.edu. I emailed that, but no response yet. I did a telnet to the smtp port at nd.edu, and did a vrfy of it. Came back with something that looked like a mailhost at irishvma, whatever that is. If you do a whois on mwc.com, it'll tell you who it is. Below is what I've gotten so far...

Don't do it!
<pre> is great for some things, but here we DON'T CARE about the
original layout, we care about the information itself. If you try to
do multiple columns, it will just make it harder to read -- and
convert to other forms.

We're using OCR to make text versions of the pages. Covers and necessary images are being scanned as JPEGs.

We won't be doing graphical scans of all the pages: its a TREMENDOUS waste of disk space (5K for the text of an average article, vs. about 1MB for the "actual digitized pages.") Its the INFORMATION that is important and useful, not the layout. And the information is much more useful and searchable as HTML.

OK, I tried RTFMing on this, but I couldn't find anything. When I'm using SozobonX to do my C programming assignments, I occassionally get memory violations (type: free) when ld is run by cc. The weird thing is, it's usually caused by adding one puts() or printf() statement; when I comment out the statement, everything is compiled and linked just fine. I suspect that ld may not be allocating enough memory for itself, and there's a switch (-B <n>) to fix this. But how do I pass ld a switch from the makefile? I tried running ls by itself on my .o files, and it was unable to find such symbols as __argc and __argv (and others, which I can't recall ATM). In what library are these symbols?

ESC j and ESC k are used internally when emulating some other ESC
sequences which makes them pretty useless.

Hello everyone.
I seem to remember seeing an ST assembler printing routine that was supposed to work far faster than the TOS effort. Can anyone got a copy or can you direct me to it?

I've looked at the TOS BIOS listing of the routine that adresses the centronics port and there are 2 aspects that really puzzle me. Why is it that:-

* there are so many successive operations putting the machine into supervisor mode, (surely one should be enough, followed at the end of the business by the restoration of user mode).
* supposing that it *is* necessary to put the machine into supervisor mode (to write to the port address), why should all interrupts be suspended? I'd like a routine I've installed running off the Timer A interrupt to continue unabated whilst the centronics port is written to. In other words, is possible to put the machine into supervisor mode whilst leaving the Timer A interrupt enabled?

As I say, what I'd really like to do is to write to the port without disabling the Timer A interrupt!

(Actually what I'd really *really* like to do is to write to the RS232 port without disabling the Timer A interrup, but I guess this is another matter altogether. Here I'd guess that other interrupts have to be disabled otherwise the timing of the serialisation process would be compromised. And so I'm settling for the centronics port).

TIA . . .
-
Steve Wilson

Not really but issue Kbdvbase() and disassemble the relevent interrupt
routine. The docs for Iorec() will tell you the buffer layout.

Then how does one access the addresses where the ST keeps the
x,y text location as asked in the ORIGINAL question???
I know I can put the cursor where I want with ESCY commands,
but how do I find where it WAS before I issue the ESCY command,
so I can put it back there????

Longword at LineA offset -28. 1st word is column, 2nd is row.

>I am trying to control the cursor from GNU C.

Some points to note ...

1) The LineA is not officially documented but I expect you would
get away with it.

2) The LineA variables can change at any time (ie system does a
VDI call). As this is related to the text cursor though, you
should find it does not get changed.

3) Due to (2) a multitasking system in theory could stuff the
values there at any time. In practice it probably won't. On
the other hand, there is no guarantee that the variables will
even exist on an alternate OS. If they do exist they may only
be valid in certain contexts.

For portability you would be better off starting with a known cursor
position and keeping track of it yourself. This method would also work
in a vt52 window for example.

>would be to send a listing of the files to a file.

Erm, I'm not too clear on your paragraph above? I'll take it to mean
coding ...

Usage: ls [-adlrt] [file ...]
When used without options or arguments, ls prints on stdout the names
of all files in the current directory, sorted alphabetically. If used
with argument 'file', it prints only 'file' if found, or an error message
if not.
Options:
-a List all files (including '.' and '..')
-d Treat directories like files
-f Flag directories with trailing "\"
-l Use long format; give full information on file type and date
-r Reverse the order of all sorting
-t Sort by times, normally newest first (default: sort by name)
-w produce wide listing (defeated by l)

so it is really only a case of using the ST functions

Fgetdta() Fsetdta() Fsfirst() Fsnext()

with appropriate formatting and filtering. Output should be via
fprintf(stdout,...). The redirection of the output is the
responsibility of the command shell.

>That's right... I was reading my manual, and realized it meant that. Still

>them in, putting them into the array, and then sort.

qsort() would be the best solution for MWC because shellsort() has a
bug which iirc limits its capability to 32K arrays.

From your description you could adopt one of two methods - either scan
the file then allocate space for the structure array and its contents
or use a linked list and allocate as you go. The first method is
easier but you would have to adopt the second if the file scanning
took too much time. Using qsort() on the 1st is trivial

qsort(array_base,num_array_elements,sizeof(structure),sort_func)

the 2nd method would require you to create an array of pointers

p = calloc(num_array_elements,sizeof(structure*));
qsort(p,num_array_elements,sizeof(structure*),sort_func)

>: MagiC does not suffer from the 40 folder bug. One thing I forgot to
>: mention is that the shell gets as far as creating the redirected file.

>
>It doesn't? Most interesting. I gotta get it sometime. So the shell just
>'forgets' to close the file after creating it? Apparently there's no error
>checking if I'm understanding you right.

I wasn't too clear. When TOS creates a file (Fcreate()) the directory
entry is created immediately. Fwrite() can then write as much data as
it likes but unless Fclose() is called that data gets lost and the
file ends up as zero length (lots of floating clusters). As MSH ends
up leaving a zero length file then it almost certainly means that MSH
must have barfed before Fclose() else the file would contain
something.

>: Here's a section showing how I added some newer Gem functions. Boring,
>: but perfectly possible. It could be simplified further with the MWC
>: library code sources because crystal() could be used I guess.

>when I was playing with my 8bit. However, if I wish to get a little more
>complex, I'll use GCC and its updated command listings.

It is. I was showing it is still possible to upgrade MWC for new
system calls. With access to the crystal() function source it would
probably be possible using only C. My guess would be that new AES and
VDI functions could be added simply by adding parameters to a table.

>: gemdos, bios and xbios functions are trivial - simply define a macro

>write the actual coding yourself, according to the stuff I've been going
>through. There are some header files that you don't write, that I've seen
>that merely help out in writing your program.

Simply adding this to osbind.h is all that is required to make MWC
support Bconmap(), a function that was not around when MWC was written

#define Bconmap(a) (long) xbios(44,a)

It's that easy!

>There's a QBBS.H file in the LazyBBS source code I've read through

Hello!

very sorry to bother you. I was wondering if someone could point me towards some good NET references on how to program on ther Atari 8-bit computer. Be in in BASIC, or Macine, Game or utility I am interested in learning how to code on the Atari, and the specifics involved with it. I am currently knowelgable of 80x86 C, ASM and of course basic. If someone could give me some starying points/books/code I would be greatly appreciative. Thanks again.

David Bennett

>should not use Line-A, correct?

Yes, use either the VDI or AES - it doesn't really matter which,
except that you should try and keep to the same "level" as best you
can. Personally, I have always used the AES graf_mouse(). Vague
description ...

control 0 78
1 1
2 1
3 1
4 0

intin 0 mouse type index (mti)

mti 0 arrow
1 vertical bar
.. (other shapes)
7 outline crosshairs
255 user defined (addrin[0] = 37 word array or NULL)
256 turn mouse off
257 turn mouse on

intout 0 0 on error, else no error.

>PS. If there's anyone else out there programming GEM in assembler, it would
>be nice to get in contact. DS.

I use C myself but I'm sure there are one or two other people who
prefer assembler. :-)

>*.warez.* is 2 days!!!!!

OK, that's exactly 2 explicit replies. I am currently working with another
person to get the proposal properly assembled; it will be announced in all of
the comp.sys.atari* groups when the RFD (Request For Discussion) is posted, and
again when the CFV (Call For Votes) comes around. You MUST subscribe to
news.groups to particiapte in the discussions - something that was /not/ told us
when the RFD to remove our previous binaries group was opened. This is a
nuisance, but you'll only have to carry the group for a month or so, as a 21-day
discussion period is required, and the CFV can take palce between 21 and 30 days
after posting.

If anyone else has any comments, PLEASE make them now, either here or in email.

What's the URL?

I did get in touch with the Webmaster at http://www.filez.com, and he's adding an "Atari" button to the search engine there. Very nice guy, I sent him the most common file extensions for Atari archives, and Hallvard's list of Atari ftp sites.

2945. MWC & CSD

Newsgroup: comp.sys.atari.programmer
Date: 1996-08-01 00:00:00 UTC
From: wtg <wtg@wtgab.demon.co.uk>
Message-ID: <31FFF629.7955@wtgab.demon.co.uk>
Source record: 9283

I bought Nark Williams C version 3.05? in the UK in (I think) 1979 or 1980. By that version all the manuals (apart from CSD) had been compiled into one huge mega-manual of around 1000 pages. As far as I know CSD was never bundled and had to be bought as a seperate product. In fact (if memory serves) I had to order it direct from MW in the USA since I couldn't find any British mail order company that stocked it. It snuck through customs in a plain brown padded envelope with a customs declaration saying there was nothing valuable inside! MWC 3.05 thru 3.09 (which is I think the last version) come on five disks and CSD comes on one disk. It is an excellent debugger with every feature you get nowadays in Delphi or CodeWarrior (and most of them worked better!)

Because I bought CSD from MW directly I got sent their various final offers including the opportunity to buy the complete source for all the libraries (I didn't).

Adding calls to new functions in the ROMS is very simple. crystal.s is provided and is the assembler binding. It is heavily commented and you just add the new function call's bindings and write the rest in C. Thats how I added the calls to the extended file Selector (the one that lets you add a custom message in the file selector). Accessing the STe's sound hardware took no more than writing a header file and a small library of functions (an evening) to make it simple in future.

Although it is a *very* K&R compiler it is one of the best - and the optimisation flags *really work*. The assembler provided is more than adequate for those little hacks required for the Vertical Blank Queue or Cookie Jars.

I'm writing this from (fond) memory as I 'upgraded' to a PowerMac in March/April '94 and sold my 4Mb STe (with NeoDesk etc) to my musician brother-in-law as a MIDI workstation...

If there is any (UK) reader of this post who wants MWC/CSD with all the manuals etc (in other words a legal transference of title to the software - no bootlegs here!) I *could* try and get them back (since he probably isn't using them!) but I imagine he'd want a few quid for them...

And it does seem *strange* that with 40 Megabytes of RAM and 1.25Gb of hard disk it seems to take *longer* to compile a project now than it did then - but thats probably nostalgia...

William T Goodall

Guy Harrison (guy@swampdog.demon.co.uk) wrote:

: Erm, I'm not too clear on your paragraph above? I'll take it to mean
: coding ...

In a way, it's coding, yes, but you mentioned a way to get the TOS code disassembled, like the German people did with MagiC. I'm familiar with the ls command, as my provider is on Suns, and uses the Unix software. Been using it for years, though I've been on for close to two years, on a shell account, never have gone SLIP or whatever.

: with appropriate formatting and filtering. Output should be via
: fprintf(stdout,...). The redirection of the output is the
: responsibility of the command shell.

Sounds about right, or so it seems. I'll later on check the MiNT sources and see how they do it. I've saved your message to a file for later use. If you're using it on a modem environment, you'll wish to direct the output to both serial and console. I'll read up more on those commands.

: >That's right... I was reading my manual, and realized it meant that. Still
: >am a bit of distance from finishing up reading it.
:
: It takes a while!

A mouthful it is, all right. Wish I could get a second manual, as it looks like I'll be constantly referring to it. I emailed the fellow who does the ST version of gcc, and asked him about a command listing, like a 'reference card' of sorts, that I could refer to. He says it should be in the archive of the gcc source code, in texinfo. Gotta check that once I get MiNT installed. Been a little busy lately. Installed a 1.6 gig drive and CD ROM into a desktop case, replacing the old ICD case, for easier access when necessary. I'm enjoying it. Even have a 50 meg partition just for MiNT itself.

: qsort() would be the best solution for MWC because shellsort() has a
: bug which iirc limits its capability to 32K arrays.

That's what I'm gonna use. I located some other sorting routines, all using qsort, including one that's a bubble sort. A friend of mine was talking about this sort of thing.

: From your description you could adopt one of two methods - either scan
: the file then allocate space for the structure array and its contents
: or use a linked list and allocate as you go. The first method is
: easier but you would have to adopt the second if the file scanning
: took too much time. Using qsort() on the 1st is trivial

I'd say the first one is good, as I'll be allocating and deallocating as I go. Transcendence has two user files, the first is just a listing of users and their handles. I'll read that. I'll have a struct arrayname of that, plus of the main user file. Once I get the number of users who are on, I'll call the next routine to sort according to your qsort line. Then on to the others, using that same qsort line being called when needed. Before I get started, I'll write up a short routine to list how many, and so on, and add to it as I go. That way, I'll have fewer errors, and the job isn't too daunting.

Like I said, a two-dimensional array, or maybe multidimensional, is what I'll be using, containing the user's handle, number of calls, downloads, uploads, and posts. Qsort will be used on that.

: I wasn't too clear. When TOS creates a file (Fcreate()) the directory
: entry is created immediately. Fwrite() can then write as much data as
: it likes but unless Fclose() is called that data gets lost and the
: file ends up as zero length (lots of floating clusters). As MSH ends
: up leaving a zero length file then it almost certainly means that MSH
: must have barfed before Fclose() else the file would contain
: _something_.

Guess someone made a nice-size programming mistake. Always include one close statement for every time you open, or check to see if it's already open before you issue the open command. Then when you quit the program or system, you get bad clusters, zero-length files, etc. I see that every now and then with some people who have horror stories of this sort of thing. I once tried defragging a friend's old IBM system, and I mean old, a microchannel. [gag] He had bad clusters all over. Every time they got fixed, more would show up, and to make things worse, more programs and directories would disappear. He takes one look at me, obviously knowing I'm getting nervous, says he'll format and reinstall. heh... Same thing can happen on any computer if you're not careful.

: It is. I was showing it is still possible to upgrade MWC for new
: system calls. With access to the crystal() function source it would
: probably be possible using only C. My guess would be that new AES and
: VDI functions could be added simply by adding parameters to a table.

Most interesting. You mention this below. This is something I have to try myself sometime. Remember I'm still trying to get started in C, and am searching for books, and have found, but not bought, them yet. Toad and Ben Smith both have some good ones. There's one I located not long ago that's not an Atari one, but will get it anyway due to the good reviews it's gotten from users. It's The Waite Group's C Primer Plus. I don't know if it sells in the UK, but I'm sure it may.

: >There's a QBBS.H file in the LazyBBS source code I've read through
: >that's in the umich archives, that seems to be a QBBS style message
: >base setup, though you have to be the one to write the actual message
: >base. Shall I post this file?
:
: ER, I dunno!

Go ahead and get it. If you can't find the file, I'll post it here for you and all. It's a pretty short file.

: From the date of the last update and the address (same as my manual),
: plus the routing you post below it looks like this could be well out
: of date. :-(

Yep. Looks like it. Joe Dennison, former MWC.com contact as you saw earlier, contacted me, and said for sure MWC is gone for good. The InterNIC has not yet removed them from their whois databases.

: Try emailing some of the people who've posted on the coherent group?
: Surely somebody there must know who took over MWC?

Likd I said above, I may have found something. Dennison gave me what looks like a possible address, so I'll be checking it out. Heck, I could probably write a text file on what I've done in my MWC searches! Now to do a crosspost on here, c.s.a.st, and c.s.a.8bit about searching for the TBBS and Forem ST authors. As you remember what I said earlier, Matt Singer said he had given the source to a couple other people, but can't remember who. So, I'm hoping someone in those groups would remember, as it seems none of those, except for a few, are here in the c.s.a.p group.

: That done, I think it can be said that enough effort has been made to
: track down the copyright?

Not yet! :-) Still am trying. Got loads of mail for awhile when I got started in the searches, and still have most of those mails, which number about 20. Once I do some more, and still fail, I can honestly say that I tried, with you and Rich backing me up, as well as all those who are reading these threads.

I've started a new thread about compiler optimization, since this one
is really about another matter.

>long's to short though 'cos MWC starts calling library subroutines for
>32 bit math! ...

Even for add and sub?
All the compilers will of course do that for the multiplication, but
as you'll see in my article only PureC actually did any multiplication
at all. I mention there that even PureC will of course use 'muls' if the
numbers are 16 bit integers.

[Clear loop code removed]

Now that sure isn't good!

[Double loop code deleted]

But that can't even work after the type of clearing I did!
It should give a bus error on the line:

>main_+0x4A adda.l (a1), a0

MWC has for some reason decided that 'array' is an array of pointers
to longs, but it isn't. It's an array of arrays of long!
(The C equivalent of a standard two dimensional array.)

It can't be legal to treat my definition/declaration of 'array' that
way. It certainly won't work in this case.

Are you sure you compiled the same program?

By the way, please direct followups to the other thread.
It's probably a good idea to include the code as well.

What happened to Michael Current's effort to get the same thing going?
In fact what happened to Michael Current? Anyway, if he is still around
maybe he already has some of the issues scanned. I had volunteered to
help but never got around to it. I do have some of the later issues
of Antic but I gave most of them away at the Atari Mistfest last month.

wtg (wtg@wtgab.demon.co.uk) wrote:

: into one huge mega-manual of around 1000 pages. As far as I know CSD was
: never bundled and had to be bought as a seperate product. In fact (if

Aha! That's what I thought. Looks like I was pretty much right on this one, saying that I thought CSD was not bundled with the MWC package. More history unfolding! Guy H, now you know. :-)

: Because I bought CSD from MW directly I got sent their various final
: offers including the opportunity to buy the complete source for all the
: libraries (I didn't).

[sigh] I wish you had. Would have been nice.

: Adding calls to new functions in the ROMS is very simple. crystal.s is
: provided and is the assembler binding. It is heavily commented and you
: just add the new function call's bindings and write the rest in C. Thats
: how I added the calls to the extended file Selector (the one that lets
: you add a custom message in the file selector). Accessing the STe's
: sound hardware took no more than writing a header file and a small
: library of functions (an evening) to make it simple in future.

If you can, can you post these? I'd love to take a look at this sort of thing, since I'm just starting out, and would like to see what others have done and so on.

: Although it is a *very* K&R compiler it is one of the best - and the
: optimisation flags *really work*. The assembler provided is more than
: adequate for those little hacks required for the Vertical Blank Queue or
: Cookie Jars.

I believe MWC, from the manuals, have an ANSI version, not just the K&R things. They released the ANSI version later on, I believe what we all have now.

: If there is any (UK) reader of this post who wants MWC/CSD with all the
: manuals etc (in other words a legal transference of title to the
: software - no bootlegs here!) I *could* try and get them back (since he
: probably isn't using them!) but I imagine he'd want a few quid for
: them...

The only problem here is that MWC is no more. They went out in early '95 after being dormant in the Atari arena for several years. You can easily sell the stuff to someone with no problems. Now just posting the stuff on the net, with the full executables and install disks, well, I don't know yet. I'm still attempting to get in contact with the former owner of MWC,

Robert Swartz. I'm getting a little close, or so it seems.

Ah, right! No, I wanted the source for the command shell (I've now
discovered it was never made public). Other command shells can
redirect ok so the bug must be in MWC. Additionally, there is mention
of something wierd about file handles in the startup code source.
Perhaps this is more than a coincidence?

If you've got a working example of the TOS Fforce() and Fdup() code
that would be good - the simpler the better. Anything I write seems to
fail - this could be down the "wierdness" in the startup code
triggering something in somw way. Who knows!

Have a look at crts0.s - they were obviously struggling with something
there. Lack of docs was probably the cause. It is just possible that
patching the MSH startup will fix it.

>Always include one close statement for every time you open, or check
>to see if it's already open before you issue the open command.

exit() will close open files for you, and iirc stdio files opened
locally should be closed when their scope ends but I would never rely
on the latter for obvious reasons. I prefer to close files myself in
any case.

It's the faster way to implement a filing system. The other way would
be to force the disk to be updated for each cluster so if there was a
crash only the current uncompleted cluster might be lost. Naturally,
this would be very slow as no cacheing of any sort would be
permissable.

>
>Are you sure you compiled the same program?

Nope, I changed the long's to ints and then because it refused to
assign "array" to a register, I tried forcing it with **a=array I
would imagine! I'm not sure exactly what I did 'cos I had been up for
over a day and deleted it as soon as I'd posted it, else we could all
see the gibberish I wrote. I do remember I didn't increase the stack
so that would have stuffed it in any case!

Let's try again ...

/* increase 2K stack a bit */

David, there is a whole world of 8-bit users and programmers out there; most of them are hanging out in comp.sys.atari.8bit, and I have a pointer to a couple of good 8-bt references at http://www.3rdplanet.com/~starship/atari.htm - you may have some problems getting in, US West (the local phone company) has major trunk line problems right now, and I don't know who owns the T-1 trunk to the Sprintlink backbone. If you can't get it today, keep trying - they promised to have it fixed before Tuesday (that's right, 5 days or more to fix major problems - that's why many people call them "US Worst").

Hmm, not much I can edit out of that. Oh, well.

If you use the service and like it, send 'em feedback. I think, like most
similar web sites, they are supported by advertising, so any feedback they get
will help them sell the site to more advertisers, allowing them to buy faster
servers and sell more ads... You know how it works. <G>

comp.sys.atari,comp.sys.atari.8bit,comp.sys.atari.advocacy,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

I just finished updating my Atari bookmarks page at
http://www.3rdplanet.com/~starship/atari.htm - the changes are mostly to make it
easier to get around on the pages, with some cosmetic mods and a bunch of new
links (including a new section, "References," for helping you find out how to do
STuff).

There are sections for both 8-bit and TOS-based systems. Pop in and take a
look sometime!

Evidently, either I write code that is very close to what the optimiser thinks is "perfect" (chuckle), or else I write code that the optimiser just wont even bother trying to unravel. Methinks it's the second. (Obfuscation rules - OK!)

Perhaps your code is written in such a manner that the optimiser can apply all it's bag of tricks to it. (Maybe you write code tuned to the tools you use?)

> >Lattice is still better than Megamax C, although not as fast as Laser C
> >(both in compilation and code produced). But it beats Laser in being able

Maybe I just wrote code that Laser found easy to optimise in the parser or the code generator phase.

I seem to recall it [Laser] was a 16-bit integer, software floating point (which got linked in even if you didn't need it, slowing everything down needlessly), and had all variables at absolute 32-bit addresses (which makes it hard to run multiple instances of the same prog in RAM using the same code segment, but different data segments for each instance)

Speed wise, a moderately graphic GEM app I wrote in 1989-91 using Megamax and then it's successor Laser C ran quite reasonably on the 1040 STFM and the Mega 4 ST that replaced it.

Laser C ran entirely in RAM, caching all files in its own RAM cache - RAM discs would slow it down.

Lattice, on the other hand, runs entirely from disc (the only exception being if the source file is open in one of the editor windows). A RAM disc would speed it up significantly.

Converting the code from Laser C's K&R syntax to the ANSI syntax when I upgraded to Lattice C in 1991 (v5.06.02) created a slower and, if I my memory serves, bulkier program. Although, some bugs in my code were squished by ANSIfying the source, the prog did no more than the previous incarnation, but ran slower.

Some more gripes I have with Lattice C:

Unrolling loops (a common first or second optimisation strategy used by most optimisers) is something Lattice C does not appear to do - even when the loop has little to do, and the index range is constant)

The supplied assembler, ASM, is hopeless when compared to Devpac 3.1 at generating Lattice C object files. One cannot unroll loops (using the REPT/ENDR combo). There are some IF/ENDC conditionals that are not as reliable as Devpac.

But, on the whole, I like it in spite of it's faults.

Guy Harrison (guy@swampdog.demon.co.uk) wrote:

: Ah, right! No, I wanted the source for the command shell (I've now
: discovered it was never made public). Other command shells can
: redirect ok so the bug must be in MWC. Additionally, there is mention
: of something wierd about file handles in the startup code source.
: Perhaps this is more than a coincidence?

I don't know... Good question. I'm not sure about the redirection thing
that you did that showed this stuff, unless I'm still confused here.
heh... Possible coincidence, I don't know. I wonder if they also found a
way to disassemble the TOS code?

: If you've got a working example of the TOS Fforce() and Fdup() code
: that would be good - the simpler the better. Anything I write seems to
: fail - this could be down the "wierdness" in the startup code
: triggering something in somw way. Who knows!

I have nothing on this yet. Probably is better to use the regular file
open/close routines.

: Someone did send me some source for shellsort() but since my HD got
: wiped I can't find anything.

Found something on one of the FTP sites out there, but nothing on
shellsort(). Lemme look at the files I found, and post what I found if it
includes shellsort(). Next message will include the bubblesort routine.

: Have a look at crts0.s - they were obviously struggling with something
: there. Lack of docs was probably the cause. It is just possible that
: patching the MSH startup will fix it.

Haven't looked at it yet. There's so many other things I'm doing now, that
I'll be looking at that later on. But of course, lack of docs can easily
be the cause, if Atari refused to provide them with what they needed.
Seems that was Atari's worst thing, forcing people to pay before they
revealed what they called proprietary secrets. Maybe some of those people
could finally bring out some of those things.

: exit() will close open files for you, and iirc stdio files opened
: locally should be closed when their scope ends but I would never rely
: on the latter for obvious reasons. I prefer to close files myself in
: any case.

As always, but there's always going to be some bug showing up that will
cause the program to open an already-opened file. The manual mentions this
as well, closing all files, flushes the buffers, and returns control to

the calling program. As usual, the Pexec() command pops up.

: It's the faster way to implement a filing system. The other way would
: be to force the disk to be updated for each cluster so if there was a
: crash only the current uncompleted cluster might be lost. Naturally,
: this would be very slow as no cacheing of any sort would be
: permissable.

Of course, a cache and be useful, but not when your system decides to take
a nosedive and take all the cache contents with it. I tried using it on my
system. Bad idea. It slowed it down so much, that a normal write took too
long to do. Haven't used it since, neither on my STE, Mega4, or 486.
Losing the current uncompleted cluster can make you lose more than your
data, rather, make you have crosslinked clusters, bad data areas, etc.
I've seen it once too often. Once on my 8bit after a rather huge download
spanning a bit of time, and a couple hundred sectors, it puked. Took two
hours to fix. Got it back. Heck, I remember losing a good file to error
164, the dreaded mislink error, which linked the sector to itself.

: >Go ahead and get it. If you can't find the file, I'll post it here for you
: >and all. It's a pretty short file.
:
: okay.

Better yet, I'll post it for all to read... As below...

Just follow the threads here on this base. We've been talking about C programming on the STs as well as some older compilers.

Rich Tietjens has a good homepage to start you out with. It's http://www.3rdplanet.com/~starship/atari.htm. I've been there and it's a rather good webpage. Mine, well, it needs improvement, but I'll be putting more stuff on it about the Atari systems, though I've got a link to one of the largest lists of links, from a fellow in France or Finland.

: Can anyone tell me a what addresses the ST keeps the x,y text location of
: the cursor??

: I am trying to control the cursor from GNU C.

Not sure if this helps, but...

Unlike the MS-DOS machines, the Atari is entirely graphic based. It doesn't have a memory location as requested, exactly. However, in the LineA variable table are a few that seem to resemble the ones you are looking for.

V_SAV_XY
-$14E to $14B (Decimal = -334 to -331)
The first word contains the horizontal position of the saved text cursor, while the second word contains its vertical position.

V_CUR_AD
-$022 to -$01F (Decimal = -034 to -031)
Current text cursor address

V_CUR_OF
-$01C to -$019 (Decimal = -030 to -029)
Byte Offset from screen base address to the top of the first text character

V_CUR_XY
-$01C to -$019 (Decimal = -028 to -025)
The character position of the text cursor. The first word contains the column number, while the second word contains the row number.

Also

DESTX
+$04C to +$04D (Decimal = +076 to +077)
Horizontal screen position where character will be printed.

DESTY
+$04E to +$04F (Decimal = +078 to +079)
Vertical screen position where character will be printed.

These are all Line A Variables. This information is from the Compute!'s Technical Reference Guide, Atari ST Volume 3 - TOS, by Sheldon Leemon.

You might also want to look at the Volume 1, which covered the VDI.

What were you trying to do?

> done and so on.

I will be posting the sources for extended file selector in MWC, STe
sound
hardware access in MWC, GEM application startup and shutdown (half way
to a
GEM application shell) and probably some other bits and pieces in a few
days.
I rescued the sources off my old hard drive (which my brother-in-law now
owns
as part of his MIDI setup) today and ZIPped them onto 720K disks which I
thought STe/NeoDesk had formatted as 720K DOS compatible disks - but my
Mac
doesn't think they are DOS disks! So I'll have to copy the files onto
REAL
DOS 720K disks on a PC or ST (Tuesday at the earliest) and sort them out
before I can post them.

> have now.

Nah, its not ANSI - but it *is* more ANSI than a lot of other compilers
of
same vintage on SUN/VAX whatever. The main ommission (and the one that
makes
people think it isn't *at all*) is ANSI function prototyping (Most other
compiler vendors put that in first and left the *more important bits*

till
later.) _But_ it does push structures onto the stack instead of
requiring
pointers (they get copied up to a limit (some weird size limited by
PC-relative addressing.)) Which I always liked because (most (of (the
(algorithms) I) write) are) recursive. (Why work out how to do it
yourself
when recursion makes the computer do the job - that's what they're for!)

Good stuff here. There's something that brings up the file selector from GEM without having to rely on programming it yourself.

Hmm... If your Mac has System 7.5 or better, it can read the DOS 1.44 disks with no trouble. You gotta thank your brother for not deleting the stuff from the hard drive, though! I do know the ST can read the DOS 720K disks, while a TT and Falcon will read 1.44 disks fine. I did a comparison of how the Falcon and IBM systems format their disks, and the Falcon gives you a few K more.

: Nah, its not ANSI - but it *is* more ANSI than a lot of other compilers
: of same vintage on SUN/VAX whatever. The main ommission (and the one

: (Why work out how to do it yourself when recursion makes the computer do
: the job - that's what they're for!)

But of course, the computer is supposed to make the job easier for the programmer instead of harder. There's been mention of stacks and pointers together and separate in my manual, which I'm about done reading, and probably will read it again. Sometimes the thing that drives you nuts is how all the vendors consider certain things important, while others aren't. Thus, you get some code that works on one compiler, but on another, you need a little modification. Then you get those packages that are so good, that they create lazy programmers, that tend to forget how to do a certain thing.

However, when you go cross-platform, you need to come up with something that will work with little or no modification, yet readable and understandable to all, even the newbies. I come across stuff every now and then that's not even commented, and the only things you gotta work with, are the system output printfs and other things. If you can't figger that thing out, then compile and run, and hope it works.

(Dave asks for programming resources for A8.)
Dave. You gotta have mapping the Atari from Compute. You have Atari BASIC. Read Bill Kendrick's Newbie FAQ on how to use Atari BASIC. (Lon Poole's 'Your Atari Computer' is a great book on it. There is much source code in magazines, assembler, BASIC and ACTION! Get some old ANALOGs, full of source code. (Antics too). Uhmm. What else. The Cleveland Freenet has a reference area that is good for a lot of things, I would not be surprised if there isn't reference materials there for programming (sorry I don't know specifically.)
There's plenty of BASIC code in the umich archive, I bet.
And finally, I'll offer you to look at my considerable pd library and you can pick BASIC programs you might want to look at, much of my pd object files I don't have source code for.

Request: Please create alt.binaries.atari.st
Use: For Atari users to send out public domain / shareware binaries,
programming efforts,
help other users with binary setup for example
Internet connection software (PPP and the like)
unmoderated, due to the lack of response from our previous moderator

This group is not to be used for the distribution of commercial software,
registration keys, etc.

SPAM, Advertisments etc, are undesirable, however tend to be impossible
to stop, but I believe that the general Atari community will not mind the
posting of such material, due to the fact that we would be able to get
and send binaries.

I believe that there some Atari binaries newsgroups floating around,
however not many people can get them, and the traffic doesn't get
distributed.

Please, comments, suggestions, alterations, and most of all support for
such a group are very welcome here!

: Request: Please create alt.binaries.atari.st

Although it is not available everywhere, alt.binaries.atari already exists expressly for the purposes you outlined in your post. alt.binaries.atari.st is unlike to propogate anywhere that a.b.a doesn't, and if the issue is 8-bit traffic in that newsgroup, the 8-bitters have their own alt.binaries group already. I think we could probably reach agreement with them not to post to each other's binaries groups. A more useful effort would be to create an Atari binaries group in the comp heirarchy, using a.b.a until said group can be created. comp.binaries.atari (or comp.banries.atari.st and comp.binaries.atari.8 if your prefer) would be accessible by more people.

Ok this is not a Question, but just to let peeps know what I am
programming, well just one question? is anyone else making any games ?

Platformer,
8 way smooth scrolling (smoother than HERO)
Animated backgrounds,
2d, but walks behind most scenery effect,
FAST 8 pixels scrolling, (think of SONIC speed):)
Hidden rooms
Invisible Platforms
Enhanced sound if run on a STe
The largest single play area seen on an ATARI Platformer,
Works on *ALL* TOS versions, *NO* fixers needed,
Needs minimum of One meg and FM or STe
Falcon Version in production, currently working but this is proving
. difficult as I dont own a bloody Falcon<G>

This is aimed to be a *Fun* fast and enjoyable platformer, with a few
difficulties, but not too many, the artwork is of the highest standard
and beats any I have used to date,Not by me I must add as I can't draw
to save my life:)

The game will be ready in time for release at the upcoming ATARI
shows,
The game will be FREEWARE and no charges,donations or any monitory
gains will be asked for,
For more information on STOSSER Softwares many FREEWARE titles, drop
into my web page:)

So anyone else making games ??

Cheers.............!ynoT

Thanks for the info :-)
What I was trying to do was to home the cursor to the top left corner after clearing the screen. This is for a C++ text adventure game which I am writing. Minor thing but makes the display a bit nicer.

I was hoping to be able to trap the cursor and eventually write a little editor but it is (obviously) not as simple as I thought :-)

Cheers,

Davy

On ATARI there are a lot of programms, that can convert a lot of
image formats . So you have to look for a programm that can do this.
(GemView, CharlyImage,Graphtool,Papillon, and so on..)
The file_format, that is known by the most graphik programms on ATARI is
the *.(x)img format.
I hope this will help you

The programmers of TOS spend a lot of effort to make it inefficient.
That's why it is so slow. And due to that it is a rather bad idea to
watch the TOS routines working to learn how it works.

> * there are so many successive operations putting the machine into

> mode whilst leaving the Timer A interrupt enabled?

Not supposing, it *is* neccessary to be in Super mode while accessing the
port. However, staying in Super mode until the access is finished should
work. And AFAIK it is not neccessary to disable interupts either for
proper port access.

> As I say, what I'd really like to do is to write to the port without
> disabling the Timer A interrupt!

Just do it.

> (Actually what I'd really *really* like to do is to write to the RS232
> port without disabling the Timer A interrup, but I guess this is
> another matter altogether. Here I'd guess that other interrupts have
> to be disabled otherwise the timing of the serialisation process would
> be compromised. And so I'm settling for the centronics port).

Any RS232 port access is even easier. All timing is done by the hardware,
so the only reason to switch off interupts is to be fast enough to catch
arriving bytes in time if a high port speed has been chosen. If you do
the receiving part as an interrupt routine triggered by the port, you
don't even need to care about this.

Note that there are more than one port on other machines, and any program doing something with one port should be able to do it with any port. This involves a fair bit of programming, of course, unless you use a serial port library, like the DEVICE-LIB by Jan Kriesten.

Cheers Peter

Doesn't MWC automatically allocate variables to registers?

[Assembly code deleted]

That's a bit worse than what TurboC/PureC did, but as for them no
real optimization is being done at all.

>Is this 16 bit / 32 bit behaviour typical of the other compilers?

Take a look at the code they produced in the other thread.

Generally, unless you specify that you want code for an '020 or better,
all multiplications by non-constants will be done via library calls.
To do differently, the compilers would have to realize that the numbers
are guaranteed to be small.
```

TurboC/PureC did the index calculation via a direct 'muls' even for long
variables, but that's because they don't allow >16 bit indices...

The problem is very likely that you use 16 bit integers (don't you?).
I think most people do that on the Atari and that upsets Lattice's optimizer.

>Perhaps your code is written in such a manner that the optimiser can apply
>all it's bag of tricks to it. (Maybe you write code tuned to the tools you
>use?)

It does happen that I write some things in ways I know GCC will handle well,
but that usually means that some other compiler will do a lousy job.
With a good compiler you really shouldn't have to worry much about the way
you write the code. As you could see in my article in the other thread,
there's often no point in using temporary pointers/values or ++addressing.

>I seem to recall it [Laser] was a 16-bit integer, software floating point
>(which got linked in even if you didn't need it, slowing everything down
>needlessly), and had all variables at absolute 32-bit addresses (which

I guess you mean all _global_ variables or it wouldn't have been possible
to do recursion. GCC normally does the same, but there's a flag that I
can't recall to make it use base relative globals instead.
I never use that flag since it tends to cause slower code.

>makes it hard to run multiple instances of the same prog in RAM using the
>same code segment, but different data segments for each instance)

I know MiNT can take advantage of such code, but I've never written any
software for which it would've been useful.

>Lattice, on the other hand, runs entirely from disc (the only exception
>being if the source file is open in one of the editor windows). A RAM disc
>would speed it up significantly.

A cached harddisk should be about the same, but I've not found a cache
program I trust on my Falcon with Outside, unfortunately.

>Unrolling loops (a common first or second optimisation strategy used by
>most optimisers) is something Lattice C does not appear to do - even when
>the loop has little to do, and the index range is constant)

Even GCC won't do that unless you tell it to.

>But, on the whole, I like it in spite of it's faults.

I very seldom use Lattice C itself, but the manuals are almost always on
my desk. The last release of them is almost unreadable, though.
Someone must have set his word processor up incorrectly.

Please DON'T DO THIS! I was the last moderator for
comp.binaries.atari.st and it was collectively decided best to
discontinue the groups. We had at most one or two postings a month!
These days it is _much_ better to upload software to a web or ftp
site and post an _announcement_ on one of the news groups!

Really, such a group is just a waste of the little bandwidth it
produces, and the space in people's .newsrc files!

I sincerely hope that people that have a memory that goes back further
than 6 months will vote NO on this RFD.

I agree with you strongly on this point. However, it is completely
impossible to keep various users from posting binaries in the
newsgroups. If they will not do it the correct way, at least give
them a place that's more appropriate. As an analogy, if you have
a dog that refuses to releive itself outdoors, do you give it
a *more* acceptable place indoors, or just allow it to continue
shitting on the sofa? These people are going to defecate in our
newsgroups, so there may as well be a more appropriate place for
it.

> I sincerely hope that people that have a memory that goes back further
> than 6 months will vote NO on this RFD.

I've read the official line on this (that the group was dissolved by
mutual agreement between you and the readership) and I've heard
stories from the other side (that the users were by and large unaware
that the group was being dissolved). For some reason, dejanews is
missing this critical period in c.b.a.st, so I can't verify either
side's story; however, I warn everyone to take both sides' claims
with a grain of salt. (I'm a bit confused by the lack of any formality
in the dissolution of the group, though. I'm aware that no procedures
exist for deleting groups, but this seemed particularly unceremonious).

Could be that the reason for the one or two posts per month was that
every time I tried to post to that group, my post never appeared! I have
heard several other people here on c.s.a.s complaining of the same
experience! If you need to do something other than just post to the group
with PINE, then there should have been a FAQ telling us how to go about
posting to the group! This was the only moderated group that I
encountered on Usenet and still have no idea what is the proper procedure
for posting to such a group!

I get quite a few floating clusters under MagiC. Most of those are
down to my programs bombing when I'm testing them. Other than having
to run something to retrieve then once a month or so, I don't get any
serious disk problems any more.

>that thing out, then compile and run, and hope it works.

Under K&R ...

```
typedef struct {
int fred,
jim;
} EG;

main()
{EG wibble;

op(wibble);
op(&wibble);
}
```

are one and the same thing (pointer always passed), whereas ansi (thus
MWC also) passes a copy of the whole structure for the 1st and a
pointer for the 2nd.

If compiling K&R code you then need to replace all occurrences of
op(wibble) with op(&wibble). It will then compile correctly on both.

That's for you to decide. They are bits unused by Gem therefore you
can use them to represent anything you want. You might implement a
FLASHABLE object for instance!

I'm looking for fellow Atari users in the
great city of Calgary, Alberta.
Is there anyone out there? If there is,
please e-mail me!!!
I'm interested in finding out just how many
Atarians there are in Calgary, and finding out
about where I can get Atari hardware/software
in Calgary.

Besides, it would be nice to see that there
are still plenty of Atari supporters around,
especially in the city where I live.

Y'all come back now, y'hear?

In general, if a moderated group has extremely low traffic (on the order of a message a year or so) and the moderator requests or agrees with the removal of the group, it will be removed. (This just recently happened with news.lists.ps-maps, for example.) Since all postings to the group have to be approved by the moderator anyway, if the moderator decides to stop approving articles the group is essentially dead. In that case, either a new moderator needs to be chosen or the group should be deleted.

I believe that the normal action for most moderated groups (news.lists.ps-maps was a special case) is to post a message to the group asking which option the readers want. I'm not familiar with the details of this particular situation.

Note followups.

You and countless others are missing the point, you only just missed
it though, in fact it's right under your nose!!!!
How many more people have joined the internet in the last 6+months?
now there is real software to use on the ATARI then more ATARIans will
join the internet, it is only in the last six months or so that the
magazines (now defunct) started to push the concept of the internet
and let the masses know that you can play on a standard ATARI ST,
What does it matter what it was like six months ago, this whole idea
started about four weeks ago and has had massive support in c.s.a.st,
you nearly had it there, it was the folk on here six months ago that
got rid of the group, NOT US <smile>

Cheers.............!ynoT

As I understand it, (and I'm no GEM programmer--next project) from what I gather from the ProGEM series by Tim Oren, to use an extended object type, you have to supply a pointer to a routine which will handle the object type. GEM obviously doesn't know what to do with it, so you have to handle it yourself. There are libraries available that supply functions to handle snazzy stuff like pop-ups...

>couple of "standard" functions, namely atof() and strtod() that don't
>work.

Just verify if _atof(and others) are in alphabetical order in libc.a.

Some linkers assume to work with sorted symbols, and have options to
go over(?) 'lib' more than once.

Float in sozobon are in another lib, but I remember some limitations
with printf and other(have a look in documentation).

With sozobon 2.0 I found a bug with optimizer(tops) with some
functions. I removed some options of tops and could re-compile libc.a
and used it. I don't know of next version.

I remember also an option speeding the link if you have enough
memory(I think more than 512K).

Please note they are old memory(5 years). So verify them.

There is a old version of GCC (can't remember wich one) working
without a multitasking OS.
It works on my F030, and I don't know if it could work if powered
by a 68000.

better clarify before it gets too confused ... :-)

This the G_PROGDEF / G_USERDEF ob_type=24. ob_spec points to a USERBLK
/ APPLBLK / APPL_BLK structure which basically describes to the AES
routines (supplied by you) which can draw and manipulate your custom
object.

The "extended flags" are available for you to use in describing
various non standard attributes of your custom object. They are not
mandatory. You could just stick with SELECTABLE for instance.

For example, if you implemented your own form_do() routine, you may
decide it would be nice to have a flashing attribute - you could then
use one bit out of the extended flags ob_flags to represent FLASHABLE,
and one out of extended flags ob_state to indicate FLASHING.

I must be missing something - surely the addition of a local
declaration and a memcpy() will simulate it?

```
ansi(a)
WHATEVER a;
{
...
ansi(a);
}
```

```
k&r(ap)
WHATEVER *ap;
{WHATEVER a;
memcpy(&a,ap,sizeof(WHATEVER));

...
k&r(&a);
}
```

>Of course nowadays passing lots of data on the stack is a *bad idea*.

True, but that was the days before decent memory allocation was
common to all systems. I remember a college Pascal which was strictly
implemented, it was therefore impossible to release dynamically
allocated memory!

Just for the hell of it one day, I got MWC to malloc() itself a new
stack each time it was nearly exhausted. Talk about non portable! :-)

>I'll leave it to the language lawyers to comment on op(wibble) vs

iirc, you are correct. op(wibble) was not legal but most compilers did
assume &wibble rather than barf.

Someone please correct me if I'm wrong here!

You can install Linux and use the whole GNU toolbox,
gcc, g++, gas, etc. but you currently need a 68030 to do so
which means you need a Falcon, TT, or bucks to add a PAK
upgrade to your ST (my be some kernel issues with PAK, not
sure about this).

I think (this is where I may be wrong) a port to the 68000
is currently being worked on but I don't know if it is available
yet so you may have to wait a while if you have your heart
set on using GNU C/C++

Regards,

Yes, people have been telling me to use the GEM-Libraries available.
However, I am doing all programming in assembler, and there are
unfortunatly no library for assembler. Thank you for your help, though!

What is your objection? No-one if forcing you to be moderator for the
new group.

>These days it is _much_ better to upload software to a web or ftp
>site and post an _announcement_ on one of the news groups!

Rather the reverse - a heavily overloaded binaries group would be
better forced onto ftp sites to reduce bandwidth.

>Really, such a group is just a waste of the little bandwidth it
>produces, and the space in people's .newsrc files!

Above.

>I sincerely hope that people that have a memory that goes back further
>than 6 months will vote NO on this RFD.

Mine does ...

I posted numerous times here and in the removed groups asking how it
was done. Never got a single reply.

In the "discussion" for its removal, I suggested you simply find
another moderator. This was ignored.

When the "discussion" was over, I voted against its removal, again
suggesting the above, or in view of the light traffic, that moderation
could be removed all together. Ignored again.

I saw 2 posts against its removal and 3 for. Nobody had a clue what was going on and ignored the thread. Perhaps you got many more but you did not summarise.

People need to be seeing software!

On a plain ST/STe set up a Minix partition (>=24Mb) under Mint
with Unix tools.

Try the german ftp sites for KGMD and umich & mirrors for GCC

There is at least GCC for MiNT. MiNT should be the standard OS for the Atari at the moment (every MagiC user trying to knock me down... MiNT is at least closer to Possix than MagiC, and Possix is still the only OS Standard availble).

It shurely can be used by any Processor. The 68K part of GCC makes 68000 code by default. In addition tis this almost every Processor up to the 040er is supportet directly via a command line Option.

I'm not shure if there is a up to date GCC version for single TOS as well.

Umich and other mirrors have MiNT, which is similar to Linux. That should do it well for you. I've been in contact with Evan Langlois about this. It'll do well for you. The Linux stuff requires the 030. I'd suggest you read up more on this. If you run onto my homepage, I have a link that allows you to go to more links, including those for MiNT and GCC. I'd suggest you have at least a meg of memory for MiNT, and a hard drive.

You may also want to look around for other compiler packages if you don't want GCC. There's the current Lattice C 5.6 currently selling at Toad Software. Older packages, if you can find them, like Mark Williams C, Megamax's Laser C, Prospero C, and others, can be found. If you do get these older packages, you must remember that the companies that developed them may not be in business any more. Mark Williams Company that made Mark Williams C is one. Prospero is still in business, from what I've seen.

Actually, you can use it without MiNT or Linux. That means you'd have to run everything in the same directory, which can give you a rather messy folder if you don't clean up every now and then.

Anyone know what happened to Brian Hauer of TSO Software's homepage? He's written that freeware BBS program that for some strange reason I keep forgetting the name. I try to get on, but all my connections time out or something. What's up?

G++ has been available for the Atari ST for as long as I can remember.
I believe the latest non-MiNT port is 2.5.8, which is relatively new.

I use 2.5.8 myself (only the C part, though) since I've not managed to
get the MiNT versions to run together with Outside on my Falcon.
(GAS seems to be the major problem for some strange reason.)

I built a cross-compiler from the 2.7.2 sources last week to see if
there were any differences, but I couldn't find any at all with my
(rather simple) test programs.

Exactly - MWC isn't fully ANSI but it *does* pass structures by value
(if you want it to) which makes a *huge* difference to the coding of
recursive routines. I remember using the Sun workstation compiler
around 1990 and although it had ANSI prototypes it didn't support
structs by value (whereas MWC didn't have ANSI prototypes but *did* have
structs by value.) A simple substitution would simply not work *at all*
(obviously - *recursion*) - you have to go and build an auxiliary stack
to keep the data structures on which uglifies a nice simple algorithm.
Of course nowadays passing lots of data on the stack is a *bad idea*.
I'll leave it to the language lawyers to comment on op(wibble) vs
```

op(&wibble) under K&R but my recollection is that only the op(&wibble) version is legal K&R and op(wibble) could only work under K&R if the compiler silently (and erroneously) changed it for you... (lint, lint, lint).

> ...
> k&r(&a);
> }

I must apologise for not making myself clear on this subject. Of
*course* I didn't mean that it was impossible to do recursion without
passing structures by value. C is a language in which you *can* do
anything. The question is *should you*. All the early versions of C++
from Bell labs (Cfront?) were implemented as a preprocessor which output
C for your local compiler using C as a kind of macro-assembler. That
```

doesn't mean you can write object-oriented software in C. (I know, I've tried).

Using memcpy() as in your example *works* but is horribly inefficient and no use for production code. I must digress here on just how *awful* memcpy is because I have seen so much bad code written using it. memcpy is *not* a panacea for problems in program design - the function is a last resort *unaligned* *bytewise* memory copy function for kluges, hacks and copying buffers. It does unaligned bytewise memory copies. The code that MWC (or any compiler) generates for pasing structures by value is *inline* and quite well optimised. (Yes - the base addresses of structures are word-aligned - unless you start mucking about with them (well maybe some implementations aren't - but only if you set the size before speed flags on a non-RISC processor) and then you start using memcpy) 4 bytes at a time (or more of course depending on the word size), then 2 and then the last odd byte. That is why if you cannot pass structures by value you have to go and design and code an alternative. An array big enough to hold one's maximum recursion depth being a typical solution.

I probably sound over-the-top about this but I spent 18 months working on real-time systems on VAXen which were being ported to OpenVMS on Alpha boxes and the amount of dross code which used memcpy written by people who assumed it was somehow *magical*....On VAXen unaligned accesses are legal (but still cause a memory cycle penalty) - on Alphas they cause an exception and the OpenVMS emulation slopes off into software to do the copy for you (at a horrible performance penalty)...

Unaligned? Once people start (mis)using memcpy they start to do wonderful things like stuff (unaligned) malloced memory full of bits of arrays of structures...

At this point in my diatribe I must break off and point out that Guy Harrison is not guilty of any of these heinous sins, he just set me off....

The point being that memcpy is guaranteed to copy the memory for you ok, but it is slooooooo.

> >Of course nowadays passing lots of data on the stack is a *bad idea*.

Actually the point was more about register allocation and optimisers, probably.

Hi Peter,

There are actually a lot of atari enthusiasts in Calgary. The city used to support four or five dealers, now sadly there are none. There are two users groups, Calgary Atari Computer Enthusiasts (CACE) and the Calgary Atari users group (CAUG). Both groups have BBS CACE at 2795375 and CAUG at 720-2286. CACE meets on the first and third mondays of the month and CAUG on the 2 and fourth wedensdays.

Your best bet for hardware and software is computer direct in Edmonton. Although most of the locals get by dealing with TOAD. It is really too bad that the there are no dealers surviving in the calgary area.

I am the liason person for CACE and I can be reached at 271-1481. (sometimes - when my wife doesn't have the falcon hooked to the net).

BTW if there are any other calgaryor area people lurking out there we would love to hear from you.

I have been asked to write a programming column for the local user group disc magazine, focusing on C.

The person who asked for it has Sozobon C, but I have Lattice 5.6.

Questions:

1) What is Sozobon C? PD/Shareware?

2) What sort of compiler is Sozobon - ANSI, K&R or ???

3) Assuming PD/Shareware, where can I locate Sozobon? How large is it (I must pay for my data transferred over the net)?

4) What are the major differences between Lattice and Sozobon? Can I take a Lattice source file and compile it unchanged?

5) Anything I should know about Sozobon before I start?

Firstly, who is included in "colletively?" I opposed the
removal, and and I think most of the netizens of
comp.sys.atari.st simply didn't know what was happening.

Secondly, the lack of postings was apparently a problem with your
email inbox, as I sent several items to you for posting during
the last months the group existed; they were neither psoted nor
acknowledged, leading me to believe that they had been rejected
without comment. If you didn't get them, it might explain why
the traffic was so low.

>These days it is _much_ better to upload software to a web or
>ftp site and post an _announcement_ on one of the news groups!

There are still many Atari users who don't have ftp access.
While archiving files is always a good idea, it is not (IMHO) the
best way to ensure wide dissemination on a rapid time scale, nor
does it ensure that the file will even be made available at the
ftp site. For example, during the past two months, I have
submitted two original packages to at least 6 different ftp
archives, including umich. So far as I have been able to
determine, the packages are now available ONLY at cnam; they have
been ignored or consigned to Coventry at all the other archives.
And, since I fix bugs and upgrade my packages continuously, even
the one at cnam is now quite out-of-date.

>Really, such a group is just a waste of the little bandwidth it
>produces, and the space in people's .newsrc files!

Considering the amount of spam arising from the thousands of
clueless commercial phone sex adverisers and the clueless "make

money fast" chain letter posters, the amount of bandwidth we are discussing here is trivial. In addition, I take issue with the concept that it would be "wasted." alt.barney.dinosaur.die.die.die is a COMPLETE waste of bandwidth, yet it's on the backbone. The several hundred users of Atari compatibles world-wide who would benefit from a moderated binaries group certainly don't consider their systems to be a "waste."

>I sincerely hope that people that have a memory that goes back
>further than 6 months will vote NO on this RFD.

In all honesty, I would expect to see an RFD to remove ALL existing Big 8 binaries groups to appear from you within a week or so, unless you simply have an ax to grind and are opposing the Atari binaries group out of some sort of spite.

I sincerely hope that people who have any sense of fair play and the ability to distinguish between new software and stale, old software, would vote YES on this RFD.

I agree, Rich; WAV files are not only too big for current technology, and of relatively poor quality, there's a version that has recently appeared that works properly only under WIN95 (no idea what Microslop has done to it, but there you are). MP2 files are smaller, higher quality, and the standard is not subject to the whims of some marketing director in Redmond. <G>

So, I'm adding my favorite group of programmers to the distribution list on this followup, in hopes that someone will compile an MP2 player that works on a bog-standard 1040ST (and auto-detects STe/TT/Falcon audio hardware and uses it, if found).

Anyone?

If I were to write C code that had to exist on more than
implementation and maintain it, I would seriously consider doing it
without any standard library functions at all, except possibly stdio.
This does not mean that the likes of strcpy() etc would not exist,
just that the source for them would exist as part of the program.

>Using memcpy() as in your example *works* but is horribly inefficient
>and no use for production code.

I agree, up to a point. I have no problems writing inefficient code if
it is clearer and does the job acceptably. If it doesn't do the job
then I do something about it.

>I must digress here on just how *awful* memcpy is because I have seen
>so much bad code written using it. memcpy is *not* a panacea for
>problems in program design - the function is a last resort *unaligned*

>2 and then the last odd byte. That is why if you cannot pass
>structures by value you have to go and design and code an alternative.
>An array big enough to hold one's maximum recursion depth being a
>typical solution.

Another problem with manual optimization is this sort of nonsense ...

```
strdup(s)
char s[];
{register char *p =malloc(strlen(s) + 1);
```

```
return p ? strcpy(p,s) : NULL;
}
```

.. leaving "register" out all together will more likely generate
better code - a decent compiler will ignore it, a not so good one will
waste time saving and restoring the register variable before issuing
the function calls - MWC will do this.

A better solution would be to duplicate the internals of strcpy() and
strlen() within strdup(), but even this could end up worse if, for
instance, the system strcpy() used a machine code string copy
instruction. With the sources incorporated into the program the
preprocessor can select the optimal choices.

>I probably sound over-the-top about this but I spent 18 months working

not to mention replacing string functions with mem functions as well!

>At this point in my diatribe I must break off and point out that Guy
>Harrison is not guilty of any of these heinous sins, he just set me
>off....

hehe, I certainly did! <G>

>The point being that memcpy is guaranteed to copy the memory for you ok,
>but it is slooooooow.

There is another, perhaps more important issue here - that of
understanding. Not many other languages give such low level access to
the system so easily and it is easily abused, not imo on purpose, but
through lack of understanding.

I gave up arguing in comp.lang.c about the "rewrite rule". I
consistently failed to get across the idea that a[] and *a are both
pointers, just one level of indirection between them. Not true, I was
told, a[] is an array, *a is a pointer, and an array isn't a pointer!

>> Just for the hell of it one day, I got MWC to malloc() itself a new

g>
g> I saw 2 posts against its removal and 3 for. Nobody had a clue what
g> was going on and ignored the thread. Perhaps you got many more but you
g> did not summarise.
g>
g> People need to be seeing software!

I got some email from Annius today at work indicating that he did get my submissions, and that he thinks he replied that they would not be posted /becasue/ the group was going to be closed. I'm afraid I may have made (yet another) net.enemy here, but that's just too damn bad. My feeling is that Annius should, rather than closing the group in a "star chamber" action (whihc is what it amounts to when you tell people that you're about to do something, and give them insufficient information to support your opposition), have sought a new moderator.

I also dislike his attitude about software piracy intensely. In fact, I would go so far as to say it absolutely sucks. But that's personal and not germaine to this discussion. ;^/

K&R I'm afraid...

>3) Assuming PD/Shareware, where can I locate Sozobon? How large is it (I
>must pay for my data transferred over the net)?

I'd get it from HENSA (ftp micros.hensa.ac.uk)
There's also a debugger available, and a package called
Heat'n'Serve Sozobon, which is a tad easier to set up. Might even come with a
graphical shell. It's also at the UMICH archive. It's not too big.

>4) What are the major differences between Lattice and Sozobon? Can I take
>a Lattice source file and compile it unchanged?

Never tried. Well, I'm sure generic stuff should port. Sozobon does come
with GEM and VDI libs, I don't know how they'd compare with Lattice. ('Cos I've
never used them, I use Lattice..)

>5) Anything I should know about Sozobon before I start?

Might be the best bet for the newcomer. You've got a fighting chance of
using it with a couple of drives and one meg. Most other P.D. compilers are a
bit long in the tooth, and GCC's enormous. ST Format used it for a C tutorial a
while back...
Have Fun,
"Augeas"

>card of all the commands that gcc reads and uses. Haven't found one yet,

Commands?
Do you mean command line parameters?

There are _lots_ of parameters you can give to GCC, but most have little
real use. The most common are:

-o filename Specify name of the created executable
-c Don't link, just compile to *.o
-O Optimize (you want to use at least this)
-O2 Optimize well (often creates much better code)
-S Don't assemble, leave compiled code as *.s
-mshort Use 16 bit integers
-m68000 Don't create >68000 code
-I path Look for header files under path
-l lib Link with the library lib

A simple build of a multi-file program could be:

Compile all the files (to *.o)
gcc -mshort -m68000 -O2 -c *.c

Link the program
gcc -o myprog.prg -mshort -m68000 *.o -lgem16

If you mean keywords, they are the same as for any C compiler, even if
GCC does have a few features of its own.

If you mean library functions, that depends on what libraries you have
of course. The standard GNU libraries can be used like any standard
ANSI C libraries.

duky@worldnet.att.net barked in COMP.SYS.ATARI.ST on 09 Aug 96:

d> I thought Atari went out of business!

That's incorrect, and irrelevant to the discussion at hand anyway.

(1) Atari (the computer company) purchased a controlling interest in JTS technologies (the hard drive company) and merged, adopting the new name and abandoning "Atari" as a brand name.

(2) Atari computers and clones thereof are still manufactured by at least three firms; C-Lab makes the Atari/C-Lab Falcon, and the Hades and Medusa workstations also run TOS (the OS-in-ROM that is the basis for Atari computers).

And, assuming that there was no one still making Atari systems, there are still hundreds of thousands of Atari computers in existence and functional. The users of these systems are no less entitled to access the Interent than any other group.

You are thinking of a progdef, or userdef object. For these, you supply
the redraw function yourself.

The "extended type" and "extended flags" however can be set on any object,
progdef or not. It is up to you what you do with them since they are not
used by GEM. You should be careful however, future AES versions may use
them, and som replacement AESs such as Geneva use some of them now.

Your point?
Just because Amiga went out of business doesn't mean that there isn't heaps of Amiga owners left surfing the net. The same applies to Atari, who has merged with JTS, but I haven't seen anything official saying that Atari is out of business.

Luke Drelick (duky@worldnet.att.net) wrote:

: I thought Atari went out of business!

Yes and no. Just because Atari went gone, or not, doesn't necessarily mean that we don't get any more support from anyone. The old 8bit systems no longer had support at all from Atari, but there is still support for it via user groups and then some. Same with the ST systems and so on. Look at the Commodore systems, the TI systems, and so on. Who gives it the most support right now? The users. Don't knock them til you've tried it.

I'm not about to start a "my computer is better than yours" war, neither do I want to see one. I'm painfully aware of a certain subject title like this back in the mid-80s when it nearly killed the backbones of the other systems on the network.. I see it nearly all the time here, with those clueless idiots who don't even know where the message is going, much less how to post a good message.

In essence, Atari is still around, alive and well, in our hearts.

I've been around here a long time and I can assure you that the old
binaries group went almost without postings for years.
Back in '88 there was some activity, but even then it wasn't much.

I don't remeber if I voted when the group removal was suggested, but if
I had, I would most definitely have voted YES.

Why, you ask?

1. Everybody with email has ftp access.
2. Everything that gets put on a binary newsgroup has to be archived
somewhere (read ftp site) as well or it'll be gone in a week or two.

>: These days it is _much_ better to upload software to a web or ftp
>: site and post an _announcement_ on one of the news groups!
>But it is not free, why should IBM users get all the free bandwidth they
>want and Atari users with none?

Uhm, in what way is ftp access less free than Usenet newsgroup access?

Usenet news distribution is _very_ far from free, while ftp only takes
net bandwidth for actual accesses.

The huge number of IBM users makes distribution via Usenet a lot more
defensible. It might even save bandwidth if a large enough number of
people want the files. That'll never be the case for Atari users.

>: Really, such a group is just a waste of the little bandwidth it
>Well if it produces little bandwidth then what's the problem?

Why don't we create 20 new Atari newsgroups?

I must admit I don't see what kind of recursive algorithms you're
implementing. If the structure by value mechanism had been able to pass
entire trees or arrays I would (for some cases), but...

Of course there must be algorithms where it's useful, but I question
how common they are.

It is of course possible to do that, but it sure won't look very pretty.
In my main project, more and more things are getting 'pseudo-objectized',

but only on a small scale, naturally.

>Using memcpy() as in your example *works* but is horribly inefficient

>hacks and copying buffers. It does unaligned bytewise memory copies. The

You're quite mistaken here, actually.

The code for memcopy() is very likely to be optimized for all kinds of
copying. It will of course do bytewise copying when necessary, but it
should also do whatever it can to make nice aligned copies _fast_.

Writing your own code instead of using memcopy is generally a _bad_ idea.

Still, if you do indeed want to pass structures by value, it's of course
best to let the compiler decide what to do. I tested GCC on this earlier
today and it will push the structure onto the stack using individual
instructions, if it's small enough. When the size reaches around 50 bytes,
GCC will call memcpy().

The tradeoff is of course the extra checks that memcpy() needs to do.

>size), then 2 and then the last odd byte. That is why if you cannot pass
>structures by value you have to go and design and code an alternative.
>An array big enough to hold one's maximum recursion depth being a
>typical solution.

OK, here we go:
What kind of recursive algorithms are you implementing?

I've written a quite a lot of recursive code, most recently a compiler
for a functional language, and I can't recall having to copy structures
at any time.

As an example, take recursion over a tree structure:
If you want to look at data anywhere, pointers work as well as copying.
If you have to update the tree, you're very likely better off with
pointers, since you then don't have to replace any nodes when the lower
recursion levels return.

For things like recursive sorts, C still can't copy arrays as parameters,
unless they're part of a structure. Always passing the complete structures
even when you've split the arrays is hardly a good idea, though.

>Alpha boxes and the amount of dross code which used memcpy written by
>people who assumed it was somehow *magical*....On VAXen unaligned

You'd normally be well advised to indeed treat memcpy() as magical. ;-)
It very likely uses assembler tricks that are better than what you could
do with C. Still, when the compiler is free to chose, such as with the
structure parameters, it's of course better to let it.

>accesses are legal (but still cause a memory cycle penalty) - on Alphas
>they cause an exception and the OpenVMS emulation slopes off into
>software to do the copy for you (at a horrible performance penalty)...

Without ever programming on an Alpha I can absolutely guarantee that
Digital's memcpy() doesn't use byte copies unless it absolutely has to.

>The point being that memcpy is guaranteed to copy the memory for you ok,
>but it is slooooooow.

No, it shouldn't be and in almost all cases is not.

Allow me to quote from the manual pages on this SPARCstation, regarding
the memXXX family of instructions:

These functions operate as efficiently as possible on memory
areas (arrays of bytes bounded by a count, not terminated by
a null character). They do not check for the overflow of
any receiving memory area.

That does _not_ mean that memcpy() is slow!

A strcpy() normally does _not_ copy a byte at a time either.
There are ways to check for the final '\0' without ever looking at
individual bytes.

There's no point trying to argue with those guys. They can quote the
complete ANSI standard at you without breaking into a sweat it appears.

While this can be annoying, it also means that they normally do know
exactly what they're talking about. If they say an array is not a
pointer, you can be certain that it says so somewhere in the standard.

While arrays and pointers are very closely related, it's not difficult
to come up with differences between 'ordinary' pointers and arrays:

An array 'pointer' 'knows' a bit (only while compiling, though) about
the area it points to when it's declared as multi-dimensional.

Excluding arrays declared as function arguments:

An array 'pointer' is always constant.
You can never have a NULL array.

<snip>

Yeah right. Sure it is. You just keep telling yourself that, buddy.

Look at the medium level computers (say a good 486 without an FPU, or mac
with a 68LC040 chip - the one without the fpu inbuilt to it)

If you ain't got an FPU, MPEG layer compression on Audio is close enough
to excruciating in the pain stakes...

It only took eight hours to decode an 80kb .mp2 file... came out as about
500 odd K of .aiff, but it came out... eventually.... now, if I only had
the years it would take to decode this 838K file.... or another computer
to sit there and decode for days (to produce a single sound?)...

Personally I believe that it would take me a lot less time to download a
28 meg wav version of a file than it would to decode a 100kb .mp2.

Hey, this computer is still fast, just not on floating point. Should see
the games rock on this computer, it processes fast, it compiles in a
flash... just without an FPU, you can forget about any kind of heavy duty
audio decoding like that.

And the same goes for RA2/3.

Anyway, .wav files are at least a standard quality. If you believe that
you can get 44khz/16bit quality output from a file compressed (with a
lossy compression system) at 10:1, you've got rocks in your head.

In terms of C, yes. However, they would not concede that in terms of
the generated code, at which point we are talking on the assembler
level, that both are pointers.

>While arrays and pointers are very closely related, it's not difficult

> You can never have a NULL array.

True. An array must always exist (even if it somehow happens to be
complete garbage), a pointer may not.

On seconds thoughts, better terminology ...

C always considers an array as valid, whereas a pointer may or may not
be valid.

The above statement, if taken literally, can be argued to fall over on ...

```
foo(s)
char s[];
```

```
{
}

main()
{char *p;

p = malloc(...)
foo(p);
}
```

.. as s[] can be NULL.

My point in the original discussion was that people learning C should take less effort to learn terminology and more on what is being hidden underneath. I failed dismally!

What is a pointer at assembler level ? Do you mean they are both
stored just in address registers ?

I think the difference between arrays and pointers is usually down to
the assembler level. With an array the base address of the array is
stored with a data register being used to index the element.

if an array is declared as 'short Array[5];' the code to address
element 3 would be something like...

```
lea Array,a0 ; Array address
move element,d0 ; Get element index
add d0,d0 ; word offset
move 0(a0, d0.w),d0 ; read element.
```

Admittedly, Array is a pointer, but it is a pointer to a list of
contiguous elements of a constant size. Whereas a 'pointer' is simply
the address of a single element.

>>While arrays and pointers are very closely related, it's not difficult

All true.

>On seconds thoughts, better terminology ...

>C always considers an array as valid, whereas a pointer may or may not
>be valid.

>The above statement, if taken literally, can be argued to fall over on ...

```
>foo(s)
>char s[];
>{

>{char *p;

> p = malloc(...)
> foo(p);
>}
```

Most modern compilers (by which I mean compilers that handle C++ and C in the same package....) would not allow the above code, or would at least give you warnings about types and parameters for this very reason.

foo(char s[]) could arguably be declared as foo(char const *s) since s is not allowed to change and any attempt to change it's value should result in an error.

foo(char s[]) should NOT be synonymous with foo(char *s) which is what your main() is passing, since char *s and char const *s are very different.

I would expect most compilers to give you parameter / prototyping errors/warnings when the above code is compiled.

Steve.

Yes, but see below.

>the address of a single element.

That's more or less all I was trying to say in comp.lang.c! I was
actually trying to say that the difference is only in indirection -
that is with Array[], you have the address directly, with *Array you
have to go via another address to get Array[], twice with **Array and
so on.

>>>While arrays and pointers are very closely related, it's not difficult

That is sensible. My example was using K&R which has no such problem
with the above code, remaining completely silent on the matter.

>foo(char s[]) could arguably be declared as foo(char const *s)
>since s is not allowed to change and any attempt to change it's value
>should result in an error.

>foo(char s[]) should NOT be synonymous with foo(char *s) which is
>what your main() is passing, since char *s and char const *s are very
>different.

Strangely enough, I put this to use in K&R. If my function is declared
foo(char s[]) then I use that to mean foo() does not alter s, whereas
if foo() is to alter s then I use foo(char *s).

>I would expect most compilers to give you parameter / prototyping
>errors/warnings when the above code is compiled.

It's been a long while since I used an ansi compiler. I'll have to
take your word on that. :-)

We finally got another shipment of MFM hard drives so we have a ton of these and now there cheap!!! Only $10 each at this price they go fast!!!!! We also sell MFM controllers at only $5.50. Hurry up and send me an order if you wand these because these will be sold out soon and we might not get any more.

I'm sorry I missed the original post, but perhaps I have something to offer. If I read this right, someone's thinking about puting the old Atari mags on the Web? If so, I have access to a potential gold mine.

My father has all of the STart magazines (with the exception of two early ones: issues one and three, I think) and a whole box of the old Antic mags, including all the ones that contained the Atari ST section (precursor to STart). The disks for all the STart mags are still in a disk case, and most should work, so it might even be possible to put those old programs on the Web. It might not be entirely legal, but who's to argue? It'd be a shame for all of that excellent software to disappear. You would, of course, have to be judiscious in putting former commercial titles up. Anyway, STart never really owned all of those programs. I know for a fact that they never payed for the programs published in the last half-dozen or more issues of STart; they still owe me a couple hundred dollars.

If the person who's doing this project would like these magazines and disks, I'm sure my dad wouldn't mind unloading them.

Regards,

Tom

time zones) who is familiar with Lattice C, ver 5.6, esp. with
their makefiles? I am trying to recompile the latest version of
Kermit and add some much needed expansions. I have e-mailed HiSoft,
who still sell LC, but don't support it anymore. The program is LARGE with
more than 20 modules, so a makefile seems the only way to go. BUT, I
can't get it to link right.
If there is someone with whom I can correspond, or even phone
about this, I would appreciate it greatly. The program compiles and runs
under MWC, but not lattice. I need Lattice, because I can get an
alarm function with it.

3048. MagiC form_x.. funcs

Newsgroup: comp.sys.atari.programmer
Date: 1996-08-13 00:00:00 UTC
From: guy@swampdog.demon.co.uk
Message-ID: <840043496_OASIS_@swampdog.demon.co.uk>
Source record: 9094

```
I've spent all afternoon trying to deal with conflicting information.
All I want, is to write MWC bindings for form_xdial() and form_xdo()!

MagiC 2 manual sez ...

form_xdial(int flag, sx,sy,sw,sh, bx,by,bw,bh; void **flydial)

control[0] 51
control[1] 9
control[2] 1
control[3] 2 <- ?
control[4] 0

intin[0] flag
intin[1..8] sx..bh

addrin[0] flydial
addrin[1] 0 <- why ?

Now, two of my other manuals say *standard* form_dial() control[3] is
*ordinarily* 0, yet when I look in the MWC code its got control[3] as
1 for a standard call. As the MagiC manual blithers on about one extra
parameter I'm totally confused. Tried just about all combinations I
can think of - the best I've managed is to pass flydial as NULL which
comes up with no dog ear. If I attempt to pass non NULL it comes back
unchanged and is either still ignored or form_xdo() bombs. I even
tried *flydial = addr_out[0] type stuff as well just in case. Nowt!

Now onto form_xdo(). Is this binding correct? ...

int form_xdo(int tree, startob, *lastcur; XDO_INF *tabs; void flydial)

control[0] 50
control[1] 1
control[2] 2
control[3] 3
control[4] 0

intin[0] startob

addrin[0] tree
addrin[1] tabs
addrin[2] flydial

intout[1] lastcur

Like I said, the dog ear never appears (when it's not crashing) but
lastcur is being returned correctly, so I at least know its making the
```

MagiC call - I was even beginning to wonder about that at one stage!

Btw, I've implemented form_xerr() and form_popup() with no trouble at all.

!Help!

A lot of our people only have access through one or another of the
Freenet systems. There is NO ftp access with a Freenet! Gopher, Lynx and
E-Mail only and most of the Gophers don't know an .lzh file from a .txt
file. Same goes for the self extracting tos archives that appear from
time to time!

> 2. Everything that gets put on a binary newsgroup has to be archived

Does give you a reason to check frequently!

> >: These days it is _much_ better to upload software to a web or ftp
> >: site and post an _announcement_ on one of the news groups!
I agree, but again not everyone can get to ftp sites, so a web site is
better, or umich which can be accessed either way, if you can get in to
ftp it there in the first place!

> >But it is not free, why should IBM users get all the free bandwidth they
> >want and Atari users with none?
With the Internet voice phone and live video for the PC's, I think the
bandwith argument is moot!

2.6.1 have some serious bug (I don't remeber what now). There is also
available 2.6.3. try:
atari.archive.umich.edu
ftp.cnam.fr (currently down :(
or some of the greman sites (ftp.uni-paderborn.de, ftp.uni-kl.de ...)

It has to be somewhere, because I've got it from the net for more then a
year.

Szymon.

Here, as promised, is the code to add the extended file dialogue to
MWC...

```
/* ok , this is the function */
/*---------------------------*/
extern long addr_in[];
extern int int_out[];

fsel_exinput(fs_iinpath,fs_innsel,fs_iexbutton,fs_label)
char *fs_iinpath;
char *fs_innsel;
int *fs_iexbutton;
char *fs_label;
{
int temp;
addr_in[0] = fs_iinpath;
addr_in[1] = fs_innsel;
addr_in[2] = fs_label;
temp = crys_if(91);
*fs_iexbutton = int_out[1];
return temp;
}

/* and this is crystal.s after I had a little look at it */

.globl crystal_
.globl ctrl_cnts_

.prvi
/
/ For GEMAES calls from AESBIND.a or cryslib.o
/

/
/ Modified 30/6/92 by WTG. The version of this .s file provided in
/ crts.a with MWC 3.0.9 DOES NOT match the version of crystal.o in
/ the file libaes.a also provided with 3.0.9! It is the same as the
/ version shipped with 3.0.5. However, after modifying this version
/ to support function 91 (and adding 55,56 which are supported in
/ 3.0.9 but not in 3.0.5) the module appears to work correctly. If
/ in doubt switch back to the old version of crystal.o, but you will
/ NOT be able to compile programs using fsel_exinput with that version
/ of the file (or rather you will, but they won't work?!).

Here is the DMA sound code for MWC I promised,

```
/* This is sound.h */
/* dma sound header file by WTG 30/1/93 */

#define SC_ENABLE (*((unsigned int *)0xff8900L))
#define SC_FB_H (*((unsigned int *)0xff8902L))
#define SC_FB_M (*((unsigned int *)0xff8904L))
#define SC_FB_L (*((unsigned int *)0xff8906L))
#define SC_FC_H (*((unsigned int *)0xff8908L))
#define SC_FC_M (*((unsigned int *)0xff890aL))
#define SC_FC_L (*((unsigned int *)0xff890cL))
#define SC_FE_H (*((unsigned int *)0xff890eL))
#define SC_FE_M (*((unsigned int *)0xff8910L))
#define SC_FE_L (*((unsigned int *)0xff8912L))
#define SC_CONTROL (*((unsigned int *)0xff8920L))

#define MDR (*((unsigned int *)0xff8922L))
#define MMR (*((unsigned int *)0xff8924L))

#define STEREO 0x00
#define MONO 0x80

#define F6258HZ 0x00
#define F12517HZ 0x01
#define F25033HZ 0x02
#define F50066HZ 0x03

#define SND_OFF 0x00
#define SND_ONCE 0x01
#define SND_RPT 0x03

void dma_samp();

/* end of sound.h */

/*--------------------*/

/*And here's the code to play sounds */
/* As in put it in a file, compile it, add it to a library with ar
....*/

#include <sound.h>
#include <osbind.h>
#include <xbios.h>

static long s_start,s_end;
static int mode,reps;
```

```
static void play()
{
SC_FB_L = (char)(s_start & 0x000000ff);

Hi,

I "inherited" a mint condition 1040ST color system. I can't
do anything with it except thinking of using it as a game machine.
Would someone kindly tell me some hot FTP sites that have Atari
ST sharewares and games?

Many thanks.

Please respond via. email.

Sang. (sangle@inow.com)

Cool. Do it and let me know what you're gonna scan.

> Have you considered including Analog and the various newsprint and
> electronic magazines on your site? You could dub yours as the "complete"
> Atari magazine archive. :)

One thing at a time -- we have 9 years of Antics & STarts to scan. That will keep us busy. I'll eventually try to get permission to put ANALOG online, too.

>E-Mail only

There are ftp-by-email servers available. Sure, it's slower than ftp,
but you get what you pay for.

>With the Internet voice phone and live video for the PC's, I think the
>bandwith argument is moot!

You mean, you get all the bandwidth you want for free, so other
people's worries don't matter?

>> The huge number of IBM users makes distribution via Usenet a lot more
>> defensible. It might even save bandwidth if a large enough number of
>> people want the files. That'll never be the case for Atari users.
>Heck, they can go into a store and buy all the software they want! 8^) We
>are rather limited in that respect!

The technical point is that, for IBM software, distribution via Usenet
uses less resources than distribution via ftp. For Atari software,
it's the other way around.

```
[ This is a draft version of an RFD intended to be posted to
news.announce.newgroups soon. It is being posted to the comp.sys.atari
groups for feedback before the final submission to David C. Lawrence,
the news.announce.newgroups moderator. Please give us your thoughts on
this proposal. Thank you. --KRH ]

REQUEST FOR DISCUSSION (RFD)
moderated group comp.binaries.atari
unmoderated group comp.binaries.atari.discuss

Newsgroup line:
comp.binaries.atari Binaries for Atari computers. (Moderated)
comp.binaries.atari.discuss Discussion of content of c.b.a.

Proponent: Rich Tietjens <starship@3rdplanet.com>
Proponent: Kyle R. Hofmann <rhofmann@crl.com>
Proponent: Adam B. Roach <adam.roach@exu.ericsson.se>

This is a formal Request For Discussion (RFD) for the creation of
world-wide moderated Usenet newsgroup comp.binaries.atari, and
unmoderated comp.binaries.atari.discuss. This is not a Call for
Votes (CFV); you cannot vote at this time. Procedural details
are below.

RATIONALE: comp.binaries.atari

Currently, there exists no appropriate and easily accessible medium
for the release of Atari software. There is also a growing pool of
software available for these machines which would recieve a
marginal distribution at best due to this lack of a medium.
Though FTP sites and several binaries newsgroups
(alt.binaries.comp.atari8bit and alt.binaries.atari) exist, many
Atarians do not have FTP access and the alt groups have a poor
distribution.

By creating comp.binaries.atari, a medium would be established.
comp.binaries.atari would provide a method of distribution. With
c.b.a, the immediate dissemination of new releases and bug fixes
would be possible.

This method also has the advantages of using comparatively fewer
system resources than other methods, and of keeping binaries out
of existing comp.sys.atari.* discussion groups.

END RATIONALE.
```

RATIONALE: comp.binaries.atari.discuss

The existence of a .discuss group allows the discussion of the binaries groups to stay separate from the actual binaries postings and from non-binary related postings. Without a discussion group, non binary posts related to the topic of the binaries heirarchy have no single place in which they can be discussed; instead, they are spread around a heirarchy of newsgroups, making worthwhile discussion difficult, if not impossible. This discussion group will create a proper place for discussion and comments on binary software posted in the comp.binaries.atari.* heirarchy.

END RATIONALE.

CHARTER: comp.binaries.atari

For the distribution of Atari compatible or Atari related software. This includes bugfixes, updates, and new releases to Atari computer software and software on other platforms related to Atari computers (such as emulators, disk image maintainers, and Atari to PC communication software). Software that has been posted within the last 60 days will be rejected; no reposts will be made within that time period. Non-binary or non-software submissions will be rejected.

The moderator will cancel any post which has been posted with a forged approval header.

Specific examples of allowed software include:

- Freely distributable software
- Revisions of previously released software
- Bugfixes of previously released software
- Commercial software with the explicit permission of the copyright holder

Specific examples of disallowed software include:

- Pictures, music, and other non-software binaries
- Recently posted software (posted within the last 60 days)
- "WaReZ", pirate software posted illegally without the copyright holder's permission
- Discussion of software posted to comp.binaries.atari
- Requests for software
- Reposts of software previously posted

END CHARTER.

CHARTER: comp.binaries.atari.discuss

This group is for the discussion of binaries posted to the group comp.binaries.atari. On topic posts include:

- Asking for alternate methods of distribution for a binary
- Discussion of the relative merits of a particular binary in comparison to competing packages
- Requests for a piece of software which has not been posted recently
- Requests for a piece of software which was incomplete to be mailed

Binaries, spams, MAKE.MONEY.FAST schemes, computer advocacy, and discussion not pertaining to the comp.binaries.atari groups is considered off topic.

END CHARTER.

MODERATOR INFO: comp.binaries.atari

Moderator: starship@3rdplanet.com (Rich Tietjens)
Backup moderator: rhofmann@crl.com (Kyle R. Hofmann)
Submission address: starship@3rdplanet.com

The moderator is author of a number of freeware packages for the TOS compatibles, active in the various Atari discussion groups, several fido-technology networks, and is employed in the networking industry.

END MODERATOR INFO.

PROCEDURE:

The discussion period lasts 21 days from the initial post of this RFD. If there are no major objections to the naming or placement, then the CFV (Call For Votes) will be issued, lasting for at least 22 days. Following the vote, there is a 5 day discussion period after which newsgroups that passed will be newgrouped by the moderator of news.announce.newgroups.

Followups to this post are directed to news.groups, which is where further discussion will take place. Cross-posted followups are discouraged. Please read news.groups to participate. Thank you!

DISTRIBUTION:

This RFD has been crossposted to:

news.announce.newgroups, news.groups, comp.sys.atari.8bit, comp.sys.atari.advocacy, comp.sys.atari.st, comp.sys.atari.st.tech, comp.sys.atari.programmer

Be nice now! You might try to get something from the a.a.u.e archive via
e-mail before you jump on me! It no longer works! Seem since "everyone has
ftp access" a lot of the ftp mail bots have been taken down! I had a copy
of that really long text file describing how to get "anything on the
internet" via e-mail, bu tit seems slightly out of date!

Excuse my ignorence in this matter, but I do have what I feel to be
a valid question,
If people are apposed to the ATARI binaries group, then why don't
they simply not subscribe to it?,
Surely this is less time consuming than moaning,

There are a lot of binaries groups I don't like, in fact the names
of some of them make me sick, so I simply don't subscribe to them,
it's a great plan and works really well,

```

This is precisely what my MagiC docs say as well. I guess addrin[1] is reserved, like with many other functions, and this is consistent with passing control[3] = two parameters.

> Now, two of my other manuals say *standard* form_dial() control[3] is
> *ordinarily* 0, yet when I look in the MWC code its got control[3] as

This is alright, since form_dial does not take any pointer parameters.

> 1 for a standard call. As the MagiC manual blithers on about one extra
> parameter I'm totally confused. Tried just about all combinations I

Why ? MWC obviously passed one parameter to many, this would hardly get noticed by AES.

> can think of - the best I've managed is to pass flydial as NULL which
> comes up with no dog ear. If I attempt to pass non NULL it comes back

Like it should do according to the docs.

> unchanged and is either still ignored or form_xdo() bombs. I even
> tried *flydial = addr_out[0] type stuff as well just in case. Nowt!

Dunno. Haven't tried that one.

* Availability

* In Brief

Many exciting developments have been taking place at EDLI, and it's about time we told you what they are! We've made the operating system more available and changed the name. Of course, we have been continually improving it, and it's got some features that even Mac and Windows don't have.
The App-Launch program and directory "bookmarks", plus the ability to play a sound or view a picture simply by clicking on the file, help users navigate and find things easily, and behind the scenes, new calls such as picture (RLE) encode-decode provide good support for new items such as movies and shrinking large picture files.
And, at last, we have some software of value to end users as well as to programmers: a means to create your own multi-media literature materials. If our plan for helping people to distribute their creations works out, you may even be able to make money writing such materials.
Everything is on-line (or about to go on line) at our web site (URL at top): the Oases system itself; programming manuals and Eazy-Asm assembler; the premiere edition of Interactive Author, the multimedia literature creation software; and more.

* System name

The OMEn (Open Multitasking ENvironment) operating system has been renamed Oases Open Software Environment (how about "Open Architecture Software Environment System", if you're hooked on acronyms). This is expected to make the system more appealing to many English speaking users, as "OMEn" always seemed to have a little black cloud over it in spite of many attempts to ward it off!

* Macintosh/Power Mac version

The Macintosh version of Oases is on sale. It runs on all tested models from Mac-512KE through Power PC 6100/60. The Macintosh version runs exactly the same software as the Atari version, except for a couple of very machine-specific programs like the Atari-ST VIDI-Recorder. The display, too, looks virtually identical to other versions. Oases for Mac will make use of any mounted Macintosh volume, including file servers and CDs. Currently Supported displays are monochrome, 256 colour and 32768 colour ("Thousands" setting).

* Other Versions

The PC porting is currently on hold owing to the range of other committments, but will certainly be completed at the earliest possible date, hopefully by the end of the year. We expect the current range of products to generate interest in a joint venture for completeing the PC and other portings.

We are planning a joint venture with another company to create an inexpensive single-board OASES "embedded control" computer based on MCF5202, Motorola's new 68000 compatible RISC processor. Becasuse Oases runs the same software on any machine, users would be able to test their software on their Atari/Mac/PC before trying it in the controller (except hardware dependent sections, of course!). This system may later be made available in a general "PC" configuration as well. Speed should be similar to the better 68EC040 systems.

* Movies

We've come out with a simple spec to define Oases movies containing animated graphics, still-picture "slides", and sound. Movies are played in the Interactive Textbook program, and other software can easily be written to play movies. The movie spec allows creation of movies and slideshows from any source of pictures and sounds.
And, we've taken a VIDI-ST video digitizer for Ataris and made the Atari-ST VIDI-Recorder program to create Oases movie animation sequences with 8 different video frame rates and sizes in four or sixteen levels of gray, with aspect ratios for most "normal" displays plus two for "ST-Medium-Rez" mode, with its tall pixels. A 2.5 or four megabyte ST or STE is demanded. The lowest frame rates and small sized pictures give over a minute of recording time on a 4 megabtye machine.
The Picture-Condenser utility program helps to trim down movies with larger pictures so they can better fit on a floppy disk. (Oases 3.38 and above automatically un-condense pictures for display.)

* Interactive Author and Interactive Textbook

These are our "star" programs. The premiere version of Interactive Author is now available on our web site (URL on letterhead). It allows its user to create and use multimedia "interactive textbook" literature on any conceivable topic, for reference works or educational curriculum.
The "pages" of the "textbooks" may contain text, pictures, sounds, slide-shows and movie clips. Page-link buttons dynamically link pages, similar to hypertext.
And, as if that wasn't enough, "evaluation" items add the ability to use Interactive Textbooks for self-paced studies and distance education: all the teacher has to do is sit the student down at the computer. The student cannot proceed through the book without correctly answering the evaluation questions, and so when he/she returns having completed the "textbook", the teacher will know the material in it has been mastered.
We hope to compile a catalog of interactive textbook multimedia literature developed by other authors, and to offer distribution with commissions/royalties for well-written, original-material-only works.
Free Interactive Textbooks are also available for download on the web site... including "Using Interactive Author", whitch contains instructions for creating your own Multi-media literature.

* Download Oases

The Oases system is "protected" by having a colour coded software licence. It may, however, be run without the licence, and is available at our world wide web site: http://www.oases.com/~omen
Without the licence, it is possible to save only small files, and not large ones, to disk. But, it is entirely possible to use it, and to run Interactive Textbooks created by other users. Distribution copies will run as licenced until the end of the month they were released: i.e, OASES338 will save any files until the end of July.

* Prices

Oases system licences, printed software development manuals and software developer registration are the only items for which EDLI currently charges: The premiere edition of Interactive Author and all our other items are free, or available on disk for shipping & handling charges.

Oases-for-Macintosh costs $69.95 Canadian. Oases-for-Atari is $44.95; or both licences for $99.95. (approx. US$ equivalents: $52.95, $33.95, and $74.95) Order by August 15th and get 25% off any above item. Order Interactive-Author Professional Edition for the special pre-release price of $69.95 Cdn/$52.95 US, with delivery late fall or early winter '96.

* Availability

Oases products are available from:

EDLI (Contact information at the top)

In the UK, Oases is also carried by:

Floppyshop
P.O. Box 273
Aberdeen, Scotland
UK AB9 8SJ
General phn., fax: (01224) 586208
Credit Card orders: (01224) 312756

We are interested in dealers... If you are an interested dealer, or know of one, please get in touch.

> does somebody have an idea why GFA-Basic V.3.6TT produces an error when
> more than 1000 string variables are filled:

I've heard of this problem before. I use 3.5e on my Falcon so I can't verify this, but I've heard that it has to do with GFA handling the strings as integer variables (I think it builds some sort of array to house them in, then assigns them some sort of number). Anyway, it is a bug in the interpreter. Try compiling the program and see if it still crashes. If it does, you'll be out of luck. GFA 3.6TT is VERY buggy, that's why I didn't upgrade. I sacrificed the interpreter running in high resolution for error-free code.

: unmoderated group comp.binaries.atari.discuss

Is it possible to just use comp.sys.atari.st to discuss stuff in comp.binaries.atari? Why create comp.binaries.atari.discuss? I know I won't go looking for something in c.b.a. unless I read about it in c.s.a.st as I don't intend to poke my nose in there if I can help it. Also, does it have to be moderated? Seems like that was the cause of problems before. And then, of course, comes the issue of: do we really need this. Right now I'd say we do, primarily because there is no satisfactory ftp site. I wish we could set up a really nice network of ftp sites (one in US, one in UK, one in Germany, France, etc...) that all mirrored the complete archive. U-Mich used to do this, but seems to have gone all rough around the edges.

As it stands, there currently is no repository that I am aware of that supports pictures or music files. I collected the 8-bit Atari .MOD music files, and would like to be able to trade and/or collect more titles. As far as I know, there are no copyright restrictions on the MOD and related music files because they were generally released anonymously.

A blanket prohibition on all music files to be overly restrictive. The music and picture files specific to the Atari 8-bit computers are small, hard to find, and tradeable. I would like to see them allowed. This request does not extend to .jpeg, .gif or other modern formats, nor to material that is already prohibitted from the Internet.

Please modify the proposal to allow music and picture files specific to the Atari 8-bit computer to be posted.

I am trying to write a vt100 front end for Kermit, and know less *C* than I should. The only things I can find in the Lattice C manual use one char at a time i/o. In the files from HSMODa07, he talks about an fcntl() function that does buffered i/o. Is that available only under mint? I have gotten the extended Lattice libs from Hensa, and there seems to be an fcntl in it. Can someone help a poor novice with some help how to use it? One char at a time seems dumb.

GFA Basic has problems with freeing the memory used by redundant strings.
The answer is to make regular use of:

~FRE(0)

wherever possible, especially in loops. This forces a garbage collection
to occur.

You need to specify what kind of Atari software is going to be on here
(8-bit, ST, TT, Falcon, whatever). Seems one user seems to think this is
for ST stuff. I'm not even sure what format this is going to be for, myself.

And if this is for 8-bit, there's already an 8-bit binaries group that
doesn't get wide distribution.

I completely agree. I remember having an extensive collection of Atari
art and certainly would like to see all that be back in circulation.
There were BBS's with literally hundreds of original art and musical
items. Where are they now?

No need for an FPU when you have a DSP chip built into the atari falcon :)
As far as I understand, that enables the falcon to play .mp2 files in real
time, and it sounds great too :)

>>So, I'm adding my favorite group of programmers to the distribution list on

I doubt there will be one for the STe/TT, but one does exist for the falcon
(look for mp2ad.lzh) on the popular ftp sites.

This may be off the mark ... but if you are talking about stdio
functions like fputc() etc then don't worry because they are buffered.
Tos functions on the other hand (like Cconout(), Bconout()) are not
buffered.

That is an understatement. The whole point of the new binary group would
be to give it wider distribution. Very few of the ISPs in my area, and
none of the universities I've heard of accept alt.binary- anything.

I expect the new binary group to allow both 8-bit and ST stuff, although
I am only interested in the 8-bit.

Actually, way back when I just started doing the internet thing, I had (and
still have,) a Freenet account. Soon after I discovered the ftpmail
servers, National Capital Freenet (Ottawa, Canada) policy changed and I
got the proverbial 'slap on the wrist' for using ftp-by-mail. This _may_
not always be a resource of last resort.

In order for the RFD to stand any chance whatsoever of passing, a
comp.binaries group must be moderated. This is one of those unwritten laws
one hears so much about. <G> For those who prefer an unmoderated venue,
alt.binaries.atari has been newgrouped (several times) and, while
distribution is spotty, is available from many sites. I can personally
assure you that the moderation this time 'round will be responsive and
active.

The discussion group, while not strictly necessary, (of course, the
whole Internet is "not strictly necessary") will help to segregate the "why
didn't my cracked copy of Lemmings get posted?" from "who has a good
routine to read the system clock?" and thus relieve clutter in c.s.a.* (at
least, that's the plan).

As for ftp sites, all I can say is, "wait until next year."

Hmmm, as long as we still prohibit MOD files (which do have an appropriate venue for distirbution), I think we might consider Atari-specific files. Technically, the "chip music" files for both the 8-bit and ST series probably could be considered binaries in that they are obviously not graphics nor text, and they aren't useful on any other platform.

8-bit graphics files are so tiny (<=8K as I recall) that I don't have a problem with that, either. ST-resolution graphics would have to be pretty special to qualify, though; 32k isn't huge but it's big enough to be a nuisance if a lot of them are posted, and frankly, while I love the systems, I am underwhelmed with most of the graphics that have been produced for it. This is a case where I think http distribution does make more sense.

Kyle, your opinion, please?

>noticed by AES.

With the MagiC docs stating that form_xdial() and form_xdo() would
behave like form_dial() and form_do() under normal Gem, and there
being 2 addrin[] parameters for one additional pointer, it could have
been that form_do() took a hidden addrin[0] of NULL. Equally, just
like you say, and most likely, the MWC binding could be buggy.

>> can think of - the best I've managed is to pass flydial as NULL which
>> comes up with no dog ear. If I attempt to pass non NULL it comes back
>
>Like it should do according to the docs.

Yep. Hardly makes it worth using like that though. :-)

>> unchanged and is either still ignored or form_xdo() bombs. I even
>> tried *flydial = addr_out[0] type stuff as well just in case. Nowt!
>
>Dunno. Haven't tried that one.

If you get a few moments I would be grateful if you could try it.
Sticking to the documentation ...

```
char *flydial;
form_xdial(FMD_START, ... , &flydial)
```

form_xdo() works as per docs if flydial=NULL on entry to the above. Naturally it is NULL on exit and gets passed to xdo() as NULL. No problem - no dog ear.

With flydial passed as non NULL (I tried -1 and 1) flydial comes out looking like a healthy pointer but xdo() almost always causes MagiC to barf. I tried swapping the xdo() tabs and flydial args just in case.

That's as far as I've got! The only idea I've got left is to tie up all the system memory just before xdial() and see if flydial comes out as NULL. If it does, it would seem to indicate the problem lies in xdo(), otherwise xdial() ?

>> Now onto form_xdo(). Is this binding correct? ...

[snip]

>Exactly like my docs are stating !

Darn again!

> a valid question,
> If people are apposed to the ATARI binaries group, then why don't
> they simply not subscribe to it?,
> Surely this is less time consuming than moaning,

I'm not sure that people *are* Opposed to a binaries group for Atari:
indeed, ever since this matter was first raised, I have kept on plugging
along with the concept of resurrecting the (it would seem) prematurely
rmgrouped moderated group, that died for one of two reasons (1) no one
was submitting anything, so the moderator decided that the group was no
longer needed, or (2) the moderator was a lazy git who arbitrarily chose
to ignore everyone's contributions. Having the group in the
comp.binaries.* hierarchy would gain far better propagation than trying
to create a new group in the alt.binaries.* one.

The reason why there is opposition to the concept of adding *any* new
binaries group is nothing to do with whether or not an end user chooses to
subscribe or not: what end users do matters not one whit to the fact that
the group would have to be propagated around the globe to all the servers
that host news (just in case an end user that *did* want to subscribe was
hosted upon that server); Brian Reid seems to have stopped producing these
statistics, but about a year ago his figures suggested that there were
380,000 servers around the world. For *any* group to be truly viable, it
helps if its traffic gets to every single one of these (some, of course,
are too small, or limited in bandwidth, and it is these that choose not
to take binaries hierarchies).

Rest assured that folks have nothing against Atari users as a breed: it's
the principle of adding additional binaries groups that is the sticking
point.

> There are a lot of binaries groups I don't like, in fact the names
> of some of them make me sick, so I simply don't subscribe to them,
> it's a great plan and works really well,

The argument that "group x.y.z exists, so why cannot a.b.c" will never
hold water, I'm afraid. In fact, it's one of the best ways to ensure
that your proposal is treated with derision.

(Maffia wants 8-bit sound and graphics files allowed in proposed
comp.sys.atari.binaries. Tietjens says maybe ok or something.)
I'm opposed to sound files and picture files, but really don't
care. I could see the binaries group get a bunch of tiny
picture and sound files. Hmmmm... I go to the midi binaries
group sometimes, it is a mish-mash of requests and binaries.
Sorta a prototype for the proposed atari. binaries. Except
Tietjens and Hofmann are looking for more 'discipline'
. Maffia wants to trade these rather rare formats of
sound and picture files. He probably has more of them
than anyone else, he's a rare bird that likes that type
of stuff. A simple post in csa8 might find out for him
if there's anybody else that likes the same type of
stuff. I like the original idea to exclude picture
and sound binaries, just have program files.

3083. gcc on TOS for DSP56k etc...

Newsgroup: comp.sys.atari.programmer
Date: 1996-08-19 00:00:00 UTC
From: Mikael Hillborg <Mikael.Hillborg@softlab.se>
Message-ID: <32185205.783B@softlab.se>
Source record: 9126

I heard there should be an older version of gcc out there somewhere, that executes on single TOS. Does it support code generation for the DSP56k or does it produce just plain old 68k code ? Where can I find that version of gcc ?

Also, when Atari was about to launch the Falcon they had a folder that described all sorts of sofware that were under development. Many of them are out now ... except for a very interesting package that was some sort of high level object oriented programming language for the DSP56k. Is anyone familiar with this ? Has anything like this been released ?

[It would be nice to program the DSP56k without sticking to assembler...]

Source record: 9127

Greetings,
I do not have an Atari computer, but I am considering buying
one (mainly for programming purposes), I have read everywhere that in
low-resolution the max colors that can appear on screen is 16? But I also
heard that you can get the full color palette on screen also, how is this
done exactly? Is it possible? What are the limitations of this technique?

I would mainly like to be able to display 64 colors on screen. I guess that if
you can display 4096, you can also display 64, no?

P.S: I am talking about the Atari STe line of computers.
Thanks in advance for your information.

That's correct; except through the use of programming tricks. By switching the palette every scan line (or, as Spectrum 512 does, 3 times each scan line), you can display the full palette in low-rez. This allows for a max of 48 colors per scan line; 48 x 200 = 4800 so in theory you could see all 4096 colors (I believe Spectrum 512 supports a lower number due to bandwidth restrictions, however). By screen flipping also, as many as 32k colors have been displayed, but it flickers rather badly on my SC1224 - 'twould probably look good on a TV set.

In article <4v0mao$5jn@mark.ucdavis.edu>, Eric Hays wrote:
: Thanks for taking the time to create this Kyle. A few comments:

: Kyle R. Hofmann (rhofmann@crl.com) wrote:
: :
: : REQUEST FOR DISCUSSION (RFD)
: : moderated group comp.binaries.atari
: : unmoderated group comp.binaries.atari.discuss

: Is it possible to just use comp.sys.atari.st to discuss stuff in
: comp.binaries.atari? Why create comp.binaries.atari.discuss?

Yes, it's possible, but not everything posted in c.b.a will be ST
related. It's better to be more general in this case and to create a
.discuss group to handle all traffic concerning c.b.a.

: I know I won't go looking for something in c.b.a. unless I read about it in
: c.s.a.st as I don't intend to poke my nose in there if I can help it.

Hmm... It would possible to allow crossposting of part 0 of uuencoded
files to other comp.sys.atari groups (part 0 is traditionally a
text description, while parts 1 and up are the file itself). Is this a
good idea? It may not be, especially if we get a lot of postings to c.b.a.

: Also, does it have to be moderated? Seems like that was the cause of
: problems before.

Yes, it does. Nobody has tried to create a moderated comp.binaries
groups since comp.binaries.apple2 a long time ago, and that was changed
to moderated eventually. The proposal won't be accepted by the
news.announce.newgroups moderator if it isn't moderated.

: And then, of course, comes the issue of: do we really
: need this.

IMHO, yes.

: Right now I'd say we do, primarily because there is no satisfactory ftp
: site. I wish we could set up a really nice network of ftp sites (one
: in US, one in UK, one in Germany, France, etc...) that all mirrored the
: complete archive. U-Mich used to do this, but seems to have gone all
: rough around the edges.

That would probably be a very good thing, but that would still exclude
those who don't have FTP access. :(This way we can include them (as
long as they have Usenet access) and not worry about having to set up FTP
sites.

: >
: >Please modify the proposal to allow music and picture files specific
: >to the Atari 8-bit computer to be posted.

: Hmmm, as long as we still prohibit MOD files (which do have an appropriate
: venue for distirbution), I think we might consider Atari-specific files.
: Technically, the "chip music" files for both the 8-bit and ST series
: probably could be considered binaries in that they are obviously not
: graphics nor text, and they aren't useful on any other platform.

This is certainly an important issue. Chip music files don't have
anywhere to go (unless one newgroups alt.binaries.chip-specific :) and do
deserve some distribution. But see below.

: 8-bit graphics files are so tiny (<=8K as I recall) that I don't have a
: problem with that, either. ST-resolution graphics would have to be pretty
: special to qualify, though; 32k isn't huge but it's big enough to be a
: nuisance if a lot of them are posted, and frankly, while I love the
: systems, I am underwhelmed with most of the graphics that have been
: produced for it. This is a case where I think http distribution does make
: more sense.

I don't have a problem with 8 bit graphics files in terms of size, but
conceptually, I can't see a group meant for Atari binaries in general
excluding binaries for the ST simply because of their size. I don't
think it would be a problem, though, as 32k isn't all that big in
comparison to other things that are posted.

I recieved e-mail concerning an issue similar to this from someone
recently, but it was more general. The issue was: What kinds of data
files are to be accepted? If you think about it, it's important if you
plan to moderate the group much more than "no WaReZ".

To my knowledge, there isn't a proposal out there that has discussed
this issue much, mainly because all the comp.binaries groups that have
been proposed so far haven't tried to limit themselves much beyond what
platform they are for.

My response to this question is that we should probably post data files used in the operation of software. For example, if I draw a picture, it wouldn't be distributable on c.b.a because, after all, it's only a picture. If I create a character set for use with a word processor, though, then that would be distributable on c.b.a because it's used during the operation of the software. (I hope you're all not confused :) Does anyone else want to contribute? If you have a good idea, post it.

All of the above. Any Atari software is acceptable. If someone writes
a Jaguar or Lynx emulator, that would be accepted too, along with
titles. This is intended as a generic Atari software group, not as an
8bit or 16bit specific Atari binaries group.

> The problem is very likely that you use 16 bit integers (don't you?).

I stopped using 16-bit integers a few years ago. My code is 90-95% 32-bit
now - only Atari OS calls and some (very) ancient code remains 16-bit.

> I think most people do that on the Atari and that upsets Lattice's optimizer.

Perhaps I tried it on some old code that wasn't fully 32-bitted, and based
my comment on that. (It was a typical blend of OS call, computation, data
validation and so forth - pretty close to what I do in all my apps)

> I guess you mean all _global_ variables or it wouldn't have been possible
> to do recursion. GCC normally does the same, but there's a flag that I
> can't recall to make it use base relative globals instead.
> I never use that flag since it tends to cause slower code.

Yes. Silly me. Absolute local vars do't make sense.

Base relative globals allows one to use threading. Absolute data
references from the code segment of the app are not fixed up when one
forks a new thread. So all threads use the same data - a bad practice
indeed.

I wouldn't mind slightly slower code if it meant better threading and
smaller app size (relative code is generally smaller than absolute)

> I know MiNT can take advantage of such code, but I've never written any
> software for which it would've been useful.

Background threads are handy. One can fork a thread to do some background
housekeeping for the app, and the main app just keeps chugging away at
what needs to be done - without worrying about "housekeeping".

> I very seldom use Lattice C itself, but the manuals are almost always on
> my desk. The last release of them is almost unreadable, though.
> Someone must have set his word processor up incorrectly.

Bitch #32: THE MANUALS FOR 5.60 DO NOT LIE FLAT!

I use the 5.0 manuals, which were ring bond, and lie flat.

Bitch #33: VOLUME 2 IS ORGANISED BADLY.

I know that I am using a function correctly, but I need to find out which header it is in. v5.0 was organised alphabetically, so finding the funtion is easy. v5.6 is alphabetical within each header file, and then alphabetically by header file name. A one step look for function name becomes a two step find it in the index and then go to page X.

Bitch #34: LATTICE WILL NOT GENERATE 32-BIT OFFSETS FOR 020+ CPUs.

The compiler will not generate 32-bit offsets when compiling for '020 or better CPUs, when near-data is selected.

The assembler allows it, but "optimises" to 16 bit. A forced 32-bit offset will not get resolved by the linker correctly.

(I sometimes have large-ish data requirements that are needed in sub-threads under MiNT, and they overflow the 64k limit on near data addressing)

It slows down the system significantly - most of the CPU time is burned up
in palette-switching. This is not a good chocie for games, unless it's a
plain-text adventure that happens to have pictures also. It would be the
worst possible choice for an "action" or "arcade" game.

: I completely agree. I remember having an extensive collection of Atari
: art and certainly would like to see all that be back in circulation.
: There were BBS's with literally hundreds of original art and musical
: items. Where are they now?

.mod files may be in some mod archive somewhere or floating out in
alt.binaries.sounds.mods. Other stuff may be lost. It's unfortunate,
but probably true. If we do eliminate the "software only" restriction,
then we would have a means of distributing these files (which are
platform specific, thus making comp.binaries.atari a good choice).

: in palette-switching. This is not a good chocie for games, unless it's a
: plain-text adventure that happens to have pictures also. It would be the
: worst possible choice for an "action" or "arcade" game.

Switching palettes more than once per scanline does eat up CPU, but
switching only once doesn't. Many games use the technique of hooking a
palette change routine to the horizontal blank. Of course, you don't get
as many colours on the screen at once, but you can do some nice stuff.
Note that I've never done this, since I don't program in assembler...

I didn't realize until now that this question went to the Usenet.
(I received it by email as well.)

The following is an extract from a Usenet article that talks about this.
At other times I've seen full strcpy() functions, but this was all I could
find in my 'archives':

...
From: Lawrence Kirby <fred@genesis.demon.co.uk>
Newsgroups: comp.arch
Subject: Re: endian-ness
Date: Sat, 25 May 96 12:20:40 GMT
...

Except that you can test fairly efficiently whether at least one byte in a
word is zero. THe following C function shows an approach:

```
/* Assumes long is 32 bits but only the constants need change for different
word (and indeed byte) sizes */

int has_zero_byte(unsigned long x)
{
unsigned long tmp;

tmp = x - 0x01010101;
x = ~x;
x &= tmp;
return (x & 0x80808080) != 0;
}
```

I don't know if this is the best approach (best is in any event architecture
dependent) however it shows a method that uses 3 basic register only
operations plus a test and a branch (in code that uses it) to check 4 bytes
(more for wider words) for a null character. On most systems this will be
faster than checking each byte individually. Real implemenatations use this
sort of trick. Coupled a big endian archetecture this allows you you avoid
byte operations on more than the first and last couple of bytes of the

string.

>The Alpha has a special instruction (CMPBGE) to compare strings 8 bytes at a
>time, and return a bit vector of the results of the byte-wise comparison.
>This does at least allow you to find the terminator quickly, and copes equally
>well with big-endian and little-endian storage.

If you have direct and fast architecture support then there is no problem.
The problem is that not all architectures have such support and those that
do are not always flexible enough to be useful in all cases.

There are relatively new versions that do so.

>code generation for the DSP56k or does it produce just
>plain old 68k code ? Where can I find that version of gcc ?

A single GCC can only produce code for one family of processors.
You have to reconfigure and recompile it to target another.
Motorola have made available the files you need to build a 56k version
of GCC 1.40 (an _old_ version), so you can do that yourself.

Take a look at http://www.bdti.com/faq/32.htm for pointers.

I believe I've seen an Atari version of the 56k GCC, but that was a long
time ago. Try searching around the Web.

>interesting package that was some sort of high level object
>oriented programming language for the DSP56k. Is anyone
>familiar with this ? Has anything like this been released ?

I've not heard of anything like that, but you could build G++. ;-)

>[It would be nice to program the DSP56k without sticking to
> assembler...]

You'll still probably have to do the important things in assembler, since
even a very good C compiler like GCC won't come close to using a chip like
the 56001 well.

AFAIK, the game 'FRONTIER' (Elite II) uses 32 colours per screen in low
res, therefore getting 32 colours should be reasonably light on CPU
cycles, since the game is still very playable.

A second hand 1 Meg STe should be around $200.

Hmm, I seem to have missed the original post...

I'm still working on UUCP-ST and Wormhole and plan to continue to do so
until (a) They're complete to my satisfaction and that of all registered
users, or (b) I finally get the message that no one wants to register
(which seems to be the case so far).

Looking for someone with tos 206, prefrably switchable?, that will test a game for me this weekend and get back to me asap,

will be a file less than one meg...probably half or so, that they can download from my page, i just give them the url, they then email me and tell me if it worked?, thats simple,

Will be ready probably over weekend or during week,

So anyone available to test for me please, tos 206, 1 meg, prefrably ste, must have access to normal tos so as to compare?

FANX :)

Cheers.............!ynoT

Greetings,
The problem is that the software that I want to create must
at least have 32 colors on screen, and that is easy on the PC and Amiga, but
after reading what the other person said, I am not sure anymore, and an Atari
costs SO MUCH money for that just 16 colors. If it would have cost 200$ for
Atari STe with 1 meg ram, I would have probably bought one to program on it...
but it costs 400$ ... and you just get 16 colors, even though the sound is
very good. I will have to think about it.

Good gods, man, who is trying to sell you an STe for $400?!? I see them
all the time for $150 to $200 (US - that's still far below the $400 CAN
you're talking about). There's a fellow in Vacnouver, WA who has one he's
asking US$200 for - want me to look him up for you?

What's the first line in your NNTP.DAT file look like?
And what do you have entered in STARTUP.NOS for nntp server?
It sounds as if you have no news server listed in STARTUP.NOS

I'm now back in fuji-land after getting a replacement Falcon and still working on "Bomb Squad", an arcade game for the Falcon. It's written in a mixture of STOS and assembler. Info can be found at http://student.canberra.edu.au/~u943409/bomb_squad.html

Cool! I read a post about this topic a while back and was wondering if any1 had got it working. Is the helper prog source available? I assume it sticks a pointer to the command line string somewhere and calls the prog using pexec?

I am working on a couple of projects including getting the code from the
book 'Black Art of 3D Game Programming' to work on the Falcon. So far
I've got the first 4 chapters worth of code working in True Color low
res(it seemed easier than working with the 256 color bitplane mode). I am
also playing around with a multithreading extension for TOS. It's tied to
the VBI for now.

3109. I had to try it!

Newsgroup: comp.sys.atari.programmer
Date: 1996-08-24 00:00:00 UTC
From: Mitch <just_ask@my.home.address>
Message-ID: <321FDB66.24FF@my.home.address>
Source record: 9052

--
Sorry to post this to your newsgroup, but I had to try it!

I read this and thought, "What could I lose?"
Read through it and maybe you'll like to try it as well!
But please be honest. That is how it works.

"MAKE-MONEY-FAST"

----- Adapted article by Jody Vining (#4 below) ----------------

Want to make a few bucks? Quick, easy and cheap?

Ok ok, we have all heard this before, laughed at it, thought it was stupid, so did I. But one day, I was bored, and wanted to see if this thing really works, the now infamous newsgroup "make-money-fast" routine.
And well, to my surprise, it ACTUALLY WORKED. I didn't make $50,000 like some said, but I DID make $3,200 in 1 month. Thats not bad for a $5 investment!

So now try it, maybe you'll make less, maybe you'll make more, but its worth a shot right?

The procedure is very simple.

STEP 1. Write your name and address on 5 separate pieces of paper with the words "PLEASE ADD ME TO YOUR MAILING LIST". Fold a $1 note or money order or bank draft in each of the pieces of paper and mail them to the following five addresses:

---
1. Sahba Zadeh, 16115 122 Pl. NE, Bothell, WA 98011, USA

2. John England, 570 Vista Ave. Palo Alto, CA 94306, USA

3. Jeannette Bidegain, 2301 Redwood Street, #1406, Las Vegas, NV 89102,USA

4. Jody Vining, 987 Shetland Ave, Winter Springs, FL, 32708

5. Mitch Whiteley, 1026 N. 510 W. Apt. 4A, Logan, UT 84341

STEP 2. Now remove the 1st name on the list, move the other 4 names up (5 becomes 4, 4 becomes 3 etc) and put your name and address as number 5 on the list. You can do this by re-typing this article or simply editing and re-posting it in this or another newsgroup.

STEP 3. Post your amended article to at least 200 new groups (there are 17 000 of them).

You are now in the Mail Order Investment Business and you will start receiving $1 returns by mail within a week or two. The more newsgroups you post to, the bigger your return will be. You may want to rent a Post Office Box to handle the volume of mail you are likely to receive.

If you wish to remain anonymous, you can use a pseudonym such as "The Manager" or "The Investor", but make sure your address is correct!

NOW LET ME TELL YOU WHY THIS SYSTEM WORKS!

Of every 200 postings I made, I received an average of 5 replies, YES - ONLY 5, each with a $1 bill enclosed. You make $5 for every 200 postings WITH YOUR NAME AT NUMBER 5.

Each person who sent you $1, now also makes let's say,only 200 additional postings WITH YOUR NAME AT NUMBER 4, i.e. 1000 postings. On average therefore, 50 people will send you $1 with your name at number 4. You make $50.

Your 50 new agents make 200 posting each WITH YOUR NAME AT NUMBER 3 or 10 000 postings - average return 500 at $1 each is $500. They make 200 postings each WITH YOUR NAME AT NUMBER 2 = 100 000 postings = 5 000 returns at $1 each = $5 000.

Finally, 5 000 people make 200 postings each WITH YOUR NAME AT NUMBER 1 and you get a return of $50 000 before you name drops off the list. AND THAT'S IF EVERYONE DOWN THE LINE ONLY MAKES 200 POSTINGS! Total income in one cycle = $55 500.

From time to time, when your name is no longer on the list, you take the latest posting that is appearing in the newsgroups, SEND OUT ANOTHER $5 TO THE NAMES THAT ARE ON THE LIST, PUT YOUR NAME IN AT NUMBER 5 AND START POSTING AGAIN. Remember, 200 postings is only a guideline. The more you post, the greater the return.

Let's review the reasons why you should do this: THE ONLY COST FACTORS ARE 5 STAMPS, 5 ENVELOPES, AND 5 $1 BILLS. Anyone can afford five dollars to put into such an effortless investment with SPECTACULAR RETURNS.

Some people have said to me "What happens if the scheme is 'played out' and no one sends me any money"? Big deal! So you lose $5 - but what are the chances of that happening?

Do you realise how many Internet Users there are? Do you realise how many times this scheme can be utilised over and over again - with COMPLETELY NEW people participating?

There are not HUNDREDS, NOT EVEN THOUSANDS, BUT HUNDREDS OF THOUSANDS OF NEW INTERNET USERS EVERY MONTH!

Remember, read the instructions carefully and play FAIRLY...that's the only way this will work. Get a printout so you can refer back to this article easily.

Try to keep a list of everyone that sends you money and always keep an eye on the newsgroup postings to make sure everyone is playing fairly. You know where your name should be.

3111. Mint, Minix, Linux problems.

Newsgroup: comp.sys.atari.programmer
Date: 1996-08-25 00:00:00 UTC
From: Mikael Hillborg <Mikael.Hillborg@softlab.se>
Message-ID: <3220A276.79B@softlab.se>
Source record: 9054

Hi!

I've tried to install MiNT and the Minix filesystem using
MINIT.TTP (minit.ttp -V -n 4 G:, where G: is a 200 MB partition
of an external SCSI drive) ... but nothing works. I downloaded the
MiNT distribution kit (9 disks), extracted disk 1, put everything
on a floppy as the docs says and then ran setup and config
from the floppy. However, MINIT.TTP just writes something
at the screen and then immediately exits. I tried
minit.ttp -V -n 4 G: by hand and it didn't work either.

I tried with the .XFS file in the MINT folder and
MINT.PRG in the AUTO folder but nothing works. Do I have to
boot with MINT.PRG and the .XFS file before executing MINIT.TTP ?

What might be wrong ?

I have a F030 (C-lab), 68881, 4 MB RAM, internal 500 MB SCSI
(C boot partition and C program partition) and an external
1 GB SCSI (E,F,G,H,I partitions) . Oh, I also had the control
panel, blow-up soft and FPATCH2 installed when I tried.

I do this just to be able to install Linux later, on top of
the Minix FS :-)
I tried finding the usr.tar.gz and root.tar.gz files for 68k-linux
but they seemed to have disappeared from most 68k-linux and replaced
in some cases by something called the watchtower-2 file system. It it
possible to use this file system. I mean, it's about 15 MB so some advice
would be nice to have before starting to ... huh ... download it.

Regards Mikael Hillborg

3113. MWC and Falcon 030

Newsgroup: comp.sys.atari.programmer
Date: 1996-08-26 00:00:00 UTC
From: a50178w8@awnet.com
Message-ID: <841107430_OASIS_@awnet.com>
Source record: 9056

HI;

I'm looking for a little help and advice from the Atari programming
community. Several years ago, when i owned a 520ST i purchased Mark Williams C
for the Atari ST. Things went on and bla bla bla... Now I own a Falcon 030 And
am wondering if i continue using MWC where would i get .h files to program for
the Falcon. Also the .RSC file for MWC only will allow the older screen
resolutions, can any of this be brought up to date?? Is MWC still supported? Do
they have an E-Mail address i can get in touch with them??
Any help would be appreciated. I haven't done any programming for years
and it's like starting all over again with a new Atari.

Mmm... Just for price comparison, I bought a second hand falcon 4/84 for less than US$400.

I'll reply to this one, everyone, since I did a bit of research on my own to come up with what he's asking. He's asking a similar question to what I asked before.

Mark Williams Company made Mark Williams C as you've noticed. The final release was 3.0.9 back in around 1988 or 1989, and then they went dormant for several years, until very early 1995 when they went out of business. There was also something about Coherent, which is a Unix clone for the IBM systems, and have their own newsgroup, comp.os.coherent, and you can find at least some of the ex-employees of there and MWC. I was in contact with a few ex-employees, including the sysadmin out there, Joe Dennison. I've not been able to find the owner of the company, Bob Swartz. I had an email address given to me by someone, but that's it. I posted a mail to him, but no reply. I even went so far as to call the 800 number that the book mentioned, but the person who answered has no idea what we're talking about. Rich Tietjens and I tried, but this guy was pretty rude. Since I'm deaf, I use my state's TTY relay service, and the two times I tried, he hung up on the relay operator before the operator could get anything out. That's rude, all right. Rich had a somewhat better experience, but from what he said, the guy had a rather thick accent or something, and he couldn't understand much.

Some of us out there still use MWC to do some programming. Some of us out there have gone on to using Lattice C or others. There's MiNT, which contains gcc, which is a C programming language in itself. My homepage has a link to the MiNT programmer and other pages from other people in this newsgroup also have links to MiNT and other things like this. I know Guy Harrison and a couple others on here, besides me, use it for some programming. I currently am doing some programming with it as well. Right now, as far as I know, the only C package that's still being updated and sold, is Lattice C, being sold by Toad Computers, version 5.6.

You may have also come across some old versions of C for the STs, like Megamax Laser C. I did not long ago, and found it was K&R C, not ANSI C, but it's great to have around to show what it was like before, when C was

still being standardized. MWC used ANSI C. I can't list everything out there in the programming section, but you get the idea.

There was a bit of discussion on C programming with MWC awhile ago on here, so if you can, search back on the posts on here, or use DejaNews and/or other Usenet search engines.

: Any help would be appreciated. I haven't done any programming
: for years and it's like starting all over again with a new Atari.

Yep. Sometimes you have to start over again. What programming languages did you use? I've done some in Basic, Cobol, some Pascal, and a little assembler, and am starting out in C, but am doing nicely.

Sorry so long, everyone, but I had to repost most everything in this one message. If I tried reposting everything posted, it would have been an exceptionally long message!

For the past 3 years I've been working on the *definitive* Empire-style strategy game in hi-res. Features include up to 6 participants, fairly intelligent computer opposition, extensive, but not cumbersome, logistics handling, about 25 different kinds of units and a cooperative interface.
I'm using GFA Basic 3.6, and at this moment I'm extending the code to provide the possibility of one of the players playing via a modem.
The program is fairly stable, containing just one more annoying bug that can crash it, and some superficial ones. It still doesn't wanna compile tho (any hints welcome on that one).

Message-ID: <322177AD.167EB0E7@kub.nl>
Source record: 9061

Hi all,

For a small GEM utility I'm writing, I want to add some extra
functionality compared to what standard GEM offers. I'm trying to get
the program to push the top window to the back, if you click on it's
move bar with the right mouse button. The easiest way to do that would
be to access the list that GEM, I assume, holds of the windows and their
respective depth, and change that. So basically I need to do the
opposite of topping a window. Can anyone confirm that GEM indeed
maintains such a list and tell me how to find/access it ?

I am trying to build a vt100 interface into Kermit. I am fixing and
expanding some *C* source from an old PD program, t100, that is on
umich. So far I have gotten most to work, except blinking chars and
scrolling. The t100 had four fonts, roman, underline, bold and reverse,
that it flips in and out with an a-line type command. These fonts are
in a text file that gets compiled along with the rest of the program.
Can anyone give me some help on how to implement these commands?
I am using Lattice C, 5.6. I also need to put in a font that has the
"real" graphics chars for VT100, rather than the non-standard vt52
stuff that Atari uses. The program has to be able to run on any ST, TT,
etc.

Blink is not a supported attribute under TOS, so in order to blink a
character, you have to keep track of where it is and constantly
erase/redraw it (or change the color to background/foreground, which
amounts to the same thing).

Creating a font is fairly easy, but unless you want to reinvent the wheel
for some reason, you'll probably be able to find a suitable font already
compiled - you could just inline the code. The font that comes with ANSIST
is quite nice, and you may even be able to get in touch with the author
(I'm not at home so I can't look him up) to get permission to use it.

Hi there!

I wish to edit resource files to give them my own personal touch (won't say which, the authors will get upset :). I'm using either WERCS or ORCS. I wish to change an icon in a dialogue box. I have designed my own icon in mono .IMG format and imported it into the ORCS icon editor. After saving the resource file, the program to which the resource belongs now doesn't run correctly when I access the particular dialogue I changed. What have I done wrong!!??!!

TIA for your help...

Chris W.

Resource editors may change the number/order of objects in object trees
as you edit them, this means the program may address the wrong objects,
maybe expecting properties that aren't there. This causes unexpected
behavior or even crashes.
I had this problems also when trying to 'translate' programs by editing
the resource files. So I wrote my own resource editor to do just this,
that guaranteed that the object numbers/properties did not change.

You can create them yourself from suitable documentation. It is easy
to add TOS functions. You may remember that these were simply macros
for gemdos(), bios() and xbios().

Similarly, Gem functions can be added. Although easier if you posess
the library source code (where you add them directly), it is perfectly
possible with a little assembler knowledge to write your own self
contained bindings for the newer calls and add them into your object
library.

> Also the .RSC file for MWC only will allow the older screen
> resolutions, can any of this be brought up to date??

No (below) but provided the resource editor will actually run then you
will be able to create resources compatible with the Falcon.

>Is MWC still supported?

No, they went bust.

Sure, GEM maintains such a list. However, the list's position and it's
structure are no documented features of the AES, so it's not appropriate
to mess around with it if you find it. This is for very good reason.
Other window managers like the one in MagiC have the list at a different
location and even use it in a different way. So please get rid of this
idea.

Newer TOS versions provide a wind_set() subfunction WF_BOTTOM, used
exactly like WF_TOP, that bottoms the referenced window.

Cheers Peter

>saving the resource file, the program to which the resource belongs now
>doesn't run correctly when I access the particular dialogue I changed.
>What have I done wrong!!??!!

As soon as you load the resource, save it with the option to write a
header turned on. Copy the header somewhere. After you've finished
fiddling, save again and compare the new header against the old. If
any of the values have changed, you're buggered. Actually no - the
program will be!

Try it again but this time just edit the existing icon. Provided you
do not perform an action that results in the editor re-ordering the
object tree it will work.

: maintains such a list and tell me how to find/access it ?

Hi,

There is actually possible to do excactly what yuu are describing with
the AES, however it's only available as of AES v4.0 (or later). You can
then send a window to the bottom by using wind_set() with mode set to 25
(WF_BOTTOMED). You receive a WM_BOTTOMED message when the user
shift-clicks on the window's mover bar.

MagiC also has support for placing windows at the bottom of the window list.

Maybe it's a bad idea to include your "extra" function as it is supported
by both MultiTOS and MagiC. If you decide to include it anyway, please
make sure neither of these systems (or any other that supports these
calls) are installed.

Take care,

Hey! what is this? How come that I have not heard of this?

Is your News-reader an Off-line or On-line newsreader.

I ask because that I and Mark Baker are working on a Off-line Newsreader.
It will be 2 programs! Babel that does the collecting, sending, maintenace
of the messages, and FireNews, which is the reader. Please tell me more
about your project (in e-mail please) so that I can inform the STiK group
about this.

I'm currently putting the finishing touches on a Top Ten program for the Transcendence BBS program, now that it works real good. I'm using an old copy of Mark Williams C, released around 1988, as many of you know from previous posts about it. I spent 3 weeks working on it, getting some help and so on, while getting to learn it. I've touched on some topics that I've wanted to learn, like file accesses, structures, arrays, and that sort of thing. Now that I bought a used copy of Lattice C 5.52, I'll probably recompile it under that, to make it run a little faster.

All I need to know how is who else on here runs Transcendence. If I get enough requests, I'll post it on here. Total size of the archive shouldn't be more than 15K, since the actual program is about 12K. Small sucker. It's pretty much bulletproof after some abuse and testing. I'll create an area on my webpage for downloading the updates later on.

: Also I am putting some C++ classes together for an X-File-y text adventure
: which with some STOS sections e.g. animations passing parameters via the
: command line.

Lots of books out there to help. Some of the best references I've found aren't exactly for the ST, but rather, written for Borland and Turbo C packages, but they do help quite a bit!

I'm using AHDI. Maybe it's MINIT.TTP that don't like external SCSI drive
partitions of that size (210 MB) ? The format seems to succeed, now with
the TAF package ... but the next step, that is making the directories with
mkdir, fails as I described in a previous posting today. I get an error
message something like, "mkdir, can't create directory /usr : error". If
I try executing mkdir directly in the shell, as opposed to from the installation
script, it also fails.

The 'P' tries to protect the Minix files system from 'TOS' accesses.

Even so, I once had my Minix partition trashed by a program that wrote directly
to the disk, & assumed it was a TOS filesystem.

I also saw problems with creating files, 'permission denied', there seens
to be a limit to the number of files/folders in the root of a partition.

Has your partition got >127 files/directories ?
Who is the owner ?

Maybe (this is a guess) the problem is with your shell, can it handle '/' ?

I tried the TAF package yesterday. I ran the setup144 script with argument h, which means install it on drive h. H is a 210 MB partition on an external SCSI drive (1 GB Conner) on my C-lab Falc. The creation of the file system seems to succeed (it reports ok) but when the script continues and tries to "mkdir /usr" it failes. Why ? I looked at the script and the file system is created with /c/minit.ttp -V -P -n 4 h.
What does -P do ? According to minit -h, it writes some kind of null file system. Is that the way it should be done ? Maybe some access rights should be set for the whole file system as it is created ? If I force a continuation, I get errors when the directories and files are trying to be written so it seems to be some access rights or so. What to do ?

/Mikael

3147. Find/change foreground app on AES 4 & compatibles?

Newsgroup: comp.sys.atari.programmer
Date: 1996-08-29 00:00:00 UTC
From: mbecroft@tos.ak.planet.gen.nz
Message-ID: <GH4SBGUVUp@tos.ak.planet.gen.nz>
Source record: 9090

I am trying to find out how to bring a task to the foreground under AES 4
and compatibles.

This can be done by selecting the application under the Desk menu, but I would
like to write software capable of bringing an application to the foreground
itself.

I have been partially successful by sending a WM_TOPPED message for one of the
application's windows, but this method fails when an application does not have
any windows open.

I would also like to be able to determine which application is currently in the
foreground. Currently, I am using menu_bar to check what menu bar is on top,
and checking the owner of the top window. This method fails, however, when
the application does not have a menu bar or any windows.

Any suggestions on either of these issues would be appreciated.

A lead programmer is required for a major developer and publisher with international acclaim.

The job description reads as follows:

• Fully conversant with 3D engines running on the PC

• Completed at least one flight simulator for a games company in a senior or team leader role

• Experience of leading a programming team and giving direction to other programmers

On offer to the successful candidate is a competitive salary, generous bonus scheme and other company benefits.

The company is based in Gloucester, England and the candidate will have to work in house.

Please reply with your resume via private email as soon as possible and we will call you to discuss the opportunity in more detail.

We look forward to hearing from you.

Pexec(10x) is supported by MagiC 5, not by earlier versions.
If it does not work, you most probably have an older version.
I completed a french version of MagiC 5 last week (5.02).

I do not know what MWC is. But some months ago I wrote a multi-thread-safe
AES library that also contains all MagiC specific functions up to MagiC 5.
The name of this library is MT_AES and it should be available on some FTP
servers or from me (by a very long uuencoded mail).
The library is mainly writte for PureC, but it includes the complete
source code.
People talked a lot about MT-programming in MiNT but never anybody did it.
Otherwise such an AES library would have been created before.

: itself.
Hmmm...If you're doing what I think you're doing, it may have already
been done. It sounds like you're writing some sort of task manager, like
that of Geneva. One already exists for AES 4; it's called Hideaway, and
it works quite nicely.
: I have been partially successful by sending a WM_TOPPED message for one of the
: application's windows, but this method fails when an application does not have
: any windows open.
Can't you send a message that the application's menu entry under the Desk
menu has been clicked upon?
: I would also like to be able to determine which application is currently in the
: foreground. Currently, I am using menu_bar to check what menu bar is on top,
: and checking the owner of the top window. This method fails, however, when
: the application does not have a menu bar or any windows.
You might check with the author of Hideaway; IIRC, it is able to do this.

I'm working on Glasnost. It's a programming language for games. It's meant
to be much better than STOS when (if) it's finished.

Use Interface. It will warn you if you are about to change the object order, as will all good RSC editors. Interface will also let you import IMGs directly into its icon editor.

oo-er!

>I would prefer to load the IMG file directly onto the existing icon as a
>replacement.

In order of preference ...

You need an editor where you can fix the object order manually, or
preferably stop it automatically re-ordering. My Mark Williams C
editor cannot do this, except in one circumstance, but perhaps
Interface can? I don't know.

The problem is that you have to delete the old icon before inserting
the new one. This re-orders the tree.

If you are capable with a disk editor and can fathom out the resource
file header it should be possible to hack the new icon over the old
provided they are the same.

The only other possible solution is to drag everything out of the tree
and then put them back, one object at a time, in the same order they
originally went in, using the editor's "test" feature as a guide. This
is a lot of messing around and may not be feasible for various
reasons.

>: Someone know the solution?

Hmm, why did I never see the original thread?

Is Pexec(100) for starting parallel apps? If so, you could use
shel_write().

shel_write(TRUE,TRUE,SHW_PARALLEL,exec,tail);

#define SHW_PARALLEL 100
#define SHW_SINGLE 101

Take care with the docs - there's a multitude of confusing and badly
named parameters for the first 3 args. Put it this way, of the four
shel_write() references I have, there are four contradictory
definitions.

One of the first TRUE parameters, if passed as FALSE should invoke a
non Gem process. I *think* this worked but was doing something else at
the time so never confirmed it.

If you use Interface for this job (and you should, it's the best
RSC-editor yet), then you do *not* have to delete the original icon.
Simply open it for editing and then import your IMG to replace the old
icon. The object tree structure is *not* altered by this.

Without looking too much at your code: you need to either disable the 200Hz
timer interrupt, or set flock ($43e IIRR) because otherwise the TOS timer
routine will access the PSG (and change the selected register) to check for
disk changes.

Hideaway does not work on programs that have no windows - thus it can get around
all the problems I am having by simply manipulating windows.

No, because this is handled internally in the AES - the program does not get
any message.

>You might check with the author of Hideaway; IIRC, it is able to do this.

Hideaway only finds programs that have windows open. Luckily, very few programs
don't have menubar or window, so it is not much of a problem.

> Hi all,

> Just out of interest - what projects are people working on??

I have been writing DESKFMT, a plug-in replacement for the MultiTOS disc formatter and copier.

<ShamelessPlug>

A list of it's features so far:

It contains the ability to run at one of three priorities - alterable on the fly.

One can create PC friendly formats, or normal Atari formats from the very restrictive SSDD 360k up to DSED 2880k. And each of the Atari formats can be extended in both tracks and sectors per track.

One can set it up to format multiple discs, prompting you when to change discs - useful when you buy no-name unformatted discs.

You can pause (stop temporarily) the format, so you can use the floppy drive for something else. Restarting the format will pick up where it left off.

You can customise the formats (ie One FAT instead of two, a smaller root directory than normal, an "odd" [strange] number of sectors per track)

The copier portion will allow you to write a copy of the disc to your hard drive as an image, as well as save just the boot sector.

You can also run that at variable priorities, pause/resume copying at the click of a mouse, create multiple discs from one source etc.

</ShamelessPlug>

Mario has been Beta testing it for a while, and I am still in the throes of improving it prior to full release.

Steven moved forward, and whispered something.
a> Organization: MiM

a> I do not know what MWC is. But some months ago I wrote a multi-thread-
a> safe AES library that also contains all MagiC specific functions up to
a> MagiC 5. The name of this library is MT_AES and it should be available
a> on some FTP servers or from me (by a very long uuencoded mail).

Any ftp addresses known? and what new AES functions are there in M5?

a> The library is mainly writte for PureC, but it includes the complete
a> source code.

What in assembler or C?

The most annoying thing about converting PureC code to Lattice is the Lattice uses long integers (32bits) so all the callbacks in the Windowed Dialog library are mucked up by the time Lattice receives them. In the end I had to receive the correct number of bytes in longs and use some logic to set the relevant variables.

See you earlier,

Steven

Thanx for the reply Michael.

I've already disabled all interrupts (as a temporary measure) by
writing #$2700 to the status register. Wouldn't this take care of the
200Hz Timer??

What's the >flock< BTW? And how do you set it?

Any other thoughts would be appreciated.
(Sorry I took so long in replying, but Compuserve is rather
temperamental when it comes to the net - you only get so many headers
in a newsgroup. I'm using another Server now)

>
>IS this version of STOS available for purchase?

A short explanation, Fracois Lionet in his infinite wisdom, created
STOS with the ability to simply add commands on and therefore update
the language by mean of extensions, once placed in the STOS folder
these will add commands to the Original STOS, not only add but in most
cases replicate, but with better and faster versions,

Had mandarin still supported STOS then each time they upgraded it
they would have added a number to the version, but they dropped
support and it was left to third party developers to do the job, this
actually had the advantage that actual STOS programmers got the
opertunity to have there say in what they want,

Subsequently STOS has had many extensions made for it, each one
enhancing the language,

You take your original old STOS, bung some extensions in the STOS
folder and you then have a highly upgraded language, hence a whole new
1996 version of STOS,

Goodmans pdl will supply you with any extensions needed and indeed
are the shareware holders for two of the most important, ie: Misty and
Missing link extensions,

I program with a far enhanced version of STOS than the original, as
far as I am concerned its been upgraded and is the 1996 version, I
hope my original post and indeed this one dident confuse anything :)

Hi there!

I'm wishing to convert some images I have into icons/images that I will be able to insert into resource files that I'm working on. What format of image does Hisoft's WImage need to be able to convert into a format that can be then imported into WERCS? ie is it GIF, TGA, JPG? etc...

TIA for any help,

Chris W.

Hmmm, I'm not sure about your code, but, to put it bluntly, it looks pretty wrong.

PSG register 7 is actually the Mixer control (pure note + noise enable/ disable) and is, according to my docs also supposed to be IO control as well, though if so it's only the top two bits (the bottom six are channels 1-3 pure note on/off, channels 1-3 noise on/off).

The following routine will send a text file to the printer:

<---begin code--->

```
; Simple code to print a text file
;
clr.l -(sp) ; supervisor
move.w #32,-(sp)
trap #1
addq.l #6,sp
move.l d0,old_usp ; save stack
lea.l file,a0 ; a0->text file
move.b (a0)+,d0 ; get first character
send_loop
bsr to_printer ; send it
move.b (a0)+,d0 ; get next
cmp.b #$ff,d0 ; end of file?
bne.s send_loop ; no, so continue sending characters
move.l old_usp,-(sp) ; user
move.w #32,-(sp)
trap #1
addq.l #6,sp
clr.w -(sp) ; exit
trap #1
;
to_printer
move.b #14,$ffff8800.w ; IO port A
ori.b #$60,$ffff8802.w ; centronics STROBE, general purpose OP
tp_online
btst.b #0,$fffffa01.w ; printer online?
bne.s tp_online
move.b #14,$ffff8800.w ; IO port A
move.b #1,$ffff8802.w ; printer font
move.b #15,$ffff8800.w ; IO port B - centronics output
move.b d0,$ffff8802.w ; character
rts
SECTION DATA
```

```
file incbin "a:\filename.ext"
dc.b $ff
SECTION BSS
even
old_usp ds.l 1

<---end code--->
```

Funnily eno\ugh, just a week ago I'd borrowed the Amiga cartridge of Mastersound 2 (which works via the printer port) in the intention of utilising it via the ST's printer port. After much TRAP following, and disassembling I gave up as it all seemed too complicated....and then I saw your routine and realised how it worked!

I'm still not 100% sure about the actual workings of this routine however... According to my docs, $ffff8802.w is used for floppy drive side select, and some other disk stuff, but also for the centronics STROBE and general purpose output (both 1 bit each). I figured selecting these two was important so did an ORI.B to turn the bits on. I assume that port A controls all that lot...

Next an online check, then select port A again and set it, then port B for centronics output and send the character. This is where my logic begins to falter: if port A was used to select the STROBE and general-purpose output (and port A also then handles the disk stuff) how it selects the printer font I've no idea. Mind you - that's only a guess that it selects the font. I originally send do to it as well but that ended up printing rubbish when I did a character test (sending 32-255 to the printer). I tried it with 1 to port A and it did the normal ascii stuff. Different values seem to select different characters, though the upper-case alphabet always appears to be there...I've seen blocks (differnt gray scales) and line-drawing characters (you know, horizontal, vertical, corners, 3-way, 4-way, etc). Sending 1 seems to work fine.

So if this is the case then how am I selecting the STROBE and gp output?!
If you remove those two lines then it doesn't seem to work!
And not selecting port A before sending the character stops it working!
And does removing the online check!

This works fine on my Epson printer, it may vary with other printers, though I suspect most are Epson compatible or work in the same (or similar) way. Note that tab sizes are selected by the printer, and are not consistent with what's on screen (mine uses 8 characters for a tab, but I prefer 4...) if you change tab size from the normal. Might be an idea to do a check for tabs and then send some spaces so you can have variable tab sizes...

I coded this with Devpac 2 and I`ve tested it and it works ok. Hopefully it'll work fine for you too.

I was sure there was something else I was going to say but...

Questions, comments fling 'em my way. Oh yeah, should be able to set tab size by escape codes to the printer, but...it's a lot of messing about. Probably easier just sending spaces. If anyone wants the docs I've got

on system variables or on $ffff8800.w and $ffff8802.w and the MFP, etc.
give me an email.

It doesn't. Font selection in all printers (assuming you're talking about
internal fonts) is via a control-escape sequence or something similar. If
you want to select a printer font under GDOS, it's still a different kettle
of fish, having nothing to do with the port.

I'm writing a really grotty fractal proglette. (Well, one day it might
not be so grotty..) Instead of being restricted to z^2+u you can enter almost
any complex expression -i.e. z^3 + cos(z) + z^z + u and it *should* be able to
do it. Runs at an absoloute crawl, though, and what's worse is that it's the
worst form of alert-ware and only likes standard ST resoloutions. I might clean
up my act later. Did anyone get my even sillier (but prettier) sierpinski gasket
prog from the PENSKE BBS ?

3196. Gcc and X11...

Newsgroup: comp.sys.atari.programmer
Date: 1996-09-08 00:00:00 UTC
From: augeas@elis.demon.co.uk
Message-ID: <842282990_OASIS_@elis.demon.co.uk>
Source record: 8989

Hello, I've just installed the T.A.F. MiNT distribution, and am now
trying to get Gcc to work. I'm using the archives from the other MiNT
distribution, (not KMGD...) all the .zoos were extracted to the right
directories and I copied the environment variables from the MINT.CNF file into
the one supplied by T.A.F. I type out a little proglette:

```
#include<stdio.h>
int main()
{
printf("Hello World ! /n");
return 0;
}
```

Typing gcc hello.c doesn't do anything ! Using the -v option showed that
only the pre-proscessor had been run. No error messages and certainly no trace
of a.out...
Help.

Also, has anyone managed to port a X11 version of Gnuplot ? what about
the X version of Fractint...

Have Fun,
"Augeas"

Thanks for the feedback.

Mmm... Segmentation fault... so you're using a Unix System to browse. Well, I don't have a browser on my Sun Ultra, I am using Netscape 3.0 on NT4/Pentium, where I developed those pages. I wonder if all the pages or just the 1st enterance page. The other browser I tested with was CAB 1.3 which works, but without the animated graphics. I will try to install a browser on the Ultra & test it out.

You can try -
http://www.geocities.com/SiliconValley/6880/phsw2.html
which where the 1st page auto jumps to for Netscape, if the 1st page crash on you.

You can also try
http://www.geocities.com/SiliconValley/6880/phem.html
as this page don't have any animated graphics, just text plus a background.

let me know. Thanks.

I never thought of that. However, it still
may be a problem, since I will not know where in the menu the program is
listed. Maybe, however, they are always sorted by application identifyer
in the desk menu, in which case I should be able to calculate which menu
entry to activate. It is worth a try.

3202. TRS-80 emulator update

Newsgroup: comp.sys.atari.programmer
Date: 1996-09-09 00:00:00 UTC
From: Sander Berents <s.j.berents@fys.ruu.nl>
Message-ID: <323408CC.23C0@fys.ruu.nl>
Source record: 8995

VERSION 0.6 OF TRS-80 EMULATOR FOR ATARI COMPUTERS AVAILABLE

Now you can download the TRS-80 model III emulator version 0.6. The package includes basic programs, machine language programs and NEWDOS/80 on 3 virtual disks. It also has a MagicMac compatibility mode and runs in all monochrome video modes. To download it go to the Atari page of
http://www.pi.net/~volatile/

The package now consists of two .ZIP files. TRS80V06.ZIP contains the minimum configuration. TRS80X06.ZIP contains conversion software and software for exchanging files between the Model III and your Atari. It also contains extra documentation.

Changes:
- Support of all monochrome video modes starting with ST high;
- Support of virtual disks with any number of tracks and sectors per track.
- ROM tape routines rerouted to disk file. This could be used by Tape to Disk copy programs. Note that the current optional CLOAD, CSAVE and SYSTEM rerouting is not changed;
- Snapshot loading/saving added. Memory, registers and options are saved;
- Changed settings on NEWDOS/80 disk. Disk 3 now defined as SS/SD disk for Model 1 disks;
- Startup message;
- NEWDOS/80 info translated to ASCII
- 2nd Connection and 2nd Convert added to the package;
- Manual, BASIC manual and other info included.

Using the included SPEED.BAS the following speed results were obtained (all numbers relative to a 2 Mhz TRS80 model III)

Tested item	ST	STE	Falcon16	TT*	630**
Integer	43	85	83	170	510 %
Floating Point	32	59	60	121	392 %
Memory	45	86	88	182	530 %
Text	170	311	311	530	1766 %
Scrolling	60	131	217	333	714 %

* TT RAM
** Apple Performa 630 running MagicMac 1.2.5
(for these tests the options "disk system" and "speed adapt" were disabled, "video acceleration and clock adapt" were enabled. The real time clock was set to "normal")

Send an email to me if you want to be added to the 2nd Life mailinglist. I will use this list to notify you about new updates, tips and tricks.

s.j.berents@fys.ruu.nl

Try GNU C or Sozobon C

I use to work with GNU, it have some bug (prototyp problems), but if you
have enough memory, it is not so bad.

Hi,

I need very very quick help for an Ethernet card called RIBEL C90.

There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030 ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?
Could you give me more informations about the jumpers because I have
no documentation of it !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herve

> test it out.

I use an Alpha running DIGITAL UNIX. for browsing. This only hapens with
Netscape. Mosaic has no problem with it. I also tried HotJava and Arena
on a SUN - No Problem. It really seems to be a bug in Netscape. Don't
ask me, what the Problem is.

> You can try -
> http://www.geocities.com/SiliconValley/6880/phsw2.html

This one has no Problem. There seem to be Problems with the Animated
GIFS (?). Just find out all the differences between the two Pages. We
can try then (email me).

Christof

I don't know of any worthwhile educational software,
but certainly the old AtariWriter word processor in
cartridge form works just fine with no disk or even
(if you don't mind not being able to save your work)
cassette. Of course, without a printer it doesn't do
anything worthwhile.

I assume that the reason you want a cartridge is becuz
you don't have a disk drive? If you DO have a disk
drive, then there are a lot more choices.

Someone mentioned you where having a relative tantrum in N.ST.FORMAT
I was told that just before it all finished, STF sent out copies of
PCFormat as some sort of prezzie to STF subscribers:) ?

>Now tell me slowly and in big letters, what is STOS, and what do you do with
>it. 8~)))

Ho alright, simple question ;), take one chair and one stool and one
stos (stos should be made of cork, 4 inch in diameter and taper off to
a point at the top), place stos on chair (pointy end up), then stand
on stool, leap off the stool so as to land in a sitting position on
the chair, you should now know what to do with your stos :)

><Shameless plug alert>. 8~)))

"plug" ? ho you already knew then :)

Cheers.............!ynoT

Right, that prevents all such problems.

SW>What's the >flock< BTW? And how do you set it?

It's a documentes TOS system variable at $43e, which is set when anyone
accesses the floppy drive. As a side effect, it makes the VBL routine not
access the PSG registers.

3215. Graphical effects under GEM

Newsgroup: comp.sys.atari.programmer
Date: 1996-09-12 00:00:00 UTC
From: Kai Holst <kh@www.hials.no>
Message-ID: <3237D824.9EC@www.hials.no>
Source record: 9008

Greetings, Atari experts.

I have recently been working on a small utilitie that functions as a small resident applications that can be used to add animations and some cool window opening and closing effects. It functions both as an accessory and application, and works both under Single-TOS, MiNT/Multi-TOS, XaAES (Reported by a beta-tester), Geneva and MagiC (Also reported by a beta-tester). It doesn't hook up to any system vectors, but lies resident waiting for messages from other programs, and understand the basic AES messages that can be thrown at it. Since it only uses documented AES and VDI calls that have existed since TOS 1.00, it should, in theory, be downwards compatible all the way.

On a bog-standard Falcon equipped with four megs of RAM running Magic it uses only about 3% of CPU time to display a 64x64 16-color animation at ten frames/second, so there's no problem in that department :)

I am looking for people to help me develop the program, and I'm trying to get people insterested in using these effects in their GEM applications. I think it would be cool if more utilities could get more graphically pleasing to use, wouldn't it? How about an animation while depacking data in ST-Zip or Lharc? While defragmenting a harddrive? While copying data? While reading mail or news? Or just an animation on the desktop, just for fun? It can be done! I just need some inspiration and help.

Limitations of the program:
- It does not convert animations between number of bitplanes - i.e. a 16-color animation only works in a 16-color mode. (actually, if the VDI rastercopy function is debugged a little, it will be possible to display a 16-color animation in both 256 color, high color and true color as well, but all current implementation of that functions do not convert between bitplanes.
- It only supports two fileformats (Neochrome and True Paint Image), which I think should be improved.
- It does not, as of yet, support packed animations (Which is too bad, as a ten-frame animation of 64x64 pixels in 16 colors stored in the True Paint format takes over 20K, and can be packed down to about 500 bytes with Lharc!
- An animation needs to be displayed on a resource object in order to be positioned correctly (If a window containing an animation is moved, my program only needs to check the XY-coordinate of the resource object that is to become an animation to know where to display it next.
- As of this moment, it only support one effect at the time, but that will change.
Development plans:
- Support for packed aniamtion files.
- Perhaps a unique animation-file system, or implementation of an existing system.
- Multiple animation support.
- Further development of the window opening and closing effects. (As of right now, it is possible to have the program close a window ten pixels at a time, or in ten steps, or any other number of pixels/time or steps. I want to make it even

better... The window opening effect will be reversed way, with opening the window ten pixels at a time, and drawing the contents while doing so... It goes without saying that this is kind of slow on most systems, but with a speedy graphics card with accelleration (NVDI comes to mind) it actually looks good!
- Does anybody have any ideas?

So, then it's just to sit around and wait for response. The source code is available upon request, as is a beta copy of Antidote, my virus killer, which uses an animation while reading bootsectors, just for the heck of it.

And the name of the program? Well, I haven't decided on that yet, but the working title is GEM-FX MkII (There was a MkI, but I wrote it in GFA Basic ages ago and it was loathsome), and it is currently being programmed in Pure C.

It takes about 10K of RAM at the current state of development.

Comments, ideas, criticism, anyone? Please forward all postings to me by mail, as I don't very often come down to reading rews...

- Kai

No, you'd just have to manually transfer the files onto a disk and wham through IOS-Mail. Or use STiK/AntMail to grab the NeST stuff, assuming you have an external modem.

See you earlier,

Steven

Could anyone point me towards Atari's Assembler Editor cartridge?
I'm putting togather an 8-bit system so that I can get back into
programming but I can't find one of these carts.
Any help would be greatly appreciated.

You don't need a Modem. If your PC has Internat acess you can install a Slip conection via a nullmodem Cable between the PC and the Atari. Even STiK can do that. Still if Ram is not the Problem on your Atari I woult prefer to install MiNT and MiNTNet. There is al lot more software available for this Combination. So you can use your Atari and the PC for Internet Access at the same Time. By the way you have a TCP/IP conection between your PC and yout Atari. So you can use stuff like ftp or even NFS for transfering files between the two.

Christof

Take a look at my Atari Bookmarks page
(http://www.3rdplanet.com/~starship/atari.htm) and you can get Wormhole, NOS,
and assorted other useful stuff. Paul Baker is the responsible party for
Net2Net. If you want to manually decode/encode your UUcoded email packets,
you don't even need Wormhole or N2N - a bare-bones system would include STiK,
Antmail, Swampdog's UUcode thingy (name escapes me ATM, sorry), IOSmail,
Tmail, and STzip. Fancier methods are possible, but that's the minimum
recommendation I could make.

Not stuck at all, Tony. You can get your packets via email on the PC,
UUdecode them to a floppy, then bung them into the Atari for processing,
reading, reply, or ignoring. Reverse the process to send your outbound.
Shoot, you can even use Ghostlink and avoid the floppy altogether.

Hi,

PLEASE - I NEED A QUICK ANSWER - I NEED REALLY QUICKLY TO MAKE THIS
CARD RUNNING !! ...

I need very very quick help for an Ethernet card called RIBEL C90.

There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030, in BNC ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?

Could you give me more informations about the jumpers because I have
no documentation of them !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Hervï¿½

From me, or from Paul Baker, or from any NeST sysop with an email account, a small amount of technical know-how, and a big heart. For the moment, if you want to choose the message areas, you need a NeST address. Read on...

>> UUdecode them to a floppy, then bung them into the Atari for processing,
s>
s> that sounds bloody perfect to me,
s>

It's easy enough, yes.

>> Shoot, you can even use Ghostlink and avoid the floppy altogether.
s>
s> bit difficult, st upstairs, pc down :)

Wire is cheap, and RS-232 will support rather long runs usually - up to a couple of hundred feet, anyway.

s> Hers a question, hope its viable, is it possible to recieve it via
s> email as a QWK package then use something like KIVI or simmilar OLR to
s> read and reply, then send back as a return QWK package, that would be
s> EVERYONES answer surely?:)

ATM, no - it would require too much manual setup on the sysop's end. Later, when I have a real UUCP here, yes, it will be possible, but right now, your best option is a NeST private node.

s> If not then can I have exact details on how to do this,
s>
s> not an url...details please if poss, I really would like to get
s> back to messaging in NeST.....<SMILE>

OK, you need to obtain all of the following:

NESTKIT (includes the NeST application and a NeSTlist, not necessarily the latest, however).
BTNC
IOSmail or Jetmail (IOS is freeware; Jetmail is faster and a bit less buggy)
Tmail, LED, or other fido-style message reader
Suitable archiver(s) (STzip recommended; ARC supported; LHA acceptable but not recommended due to too many semi-compatible versions)
UUcode software (ESScode or Guy Harrison's UUcoder recommended)

Patience.

You have to fill in your NeST app and submit it as a private node to whomever you wish to get your feed from with a request to have it forwarded to the proper RC. Use the temporary address (90:XXX/999.0 where XXX is the rgion you'll be connecting to) to set up BTNC, IOS/Jetmail, and your mail reader while you wait for a reply.

You /must/ be able to write and pack netmail in order to get a node number. The only tricky part will be manually UUcoding the outbound packets, which must be emailed to AUTONET at your host system (me or Paul, or whoever else joins the club). The email subject should be "AUTONET Packet" - the content should be nothing but the UUcoded fido packet.

When you get email addressed to AUTONET (or with AUTONET packet in the subject line), UUdecode it to a floppy and move it to your INBOUND folder, or UUdecode it directly to INBOUND. Then run IOS or Jetmail to import the packet.

It sounds complex, but the whole process takes less than a minute once you have your private node set up.

All the necessary files are available at ftp://ftp.teleport.com/users/atari

Good luck!

Nope - Net2Net converts FTN newsgroups to email - It doesn't matter what machine you use, if it reads email you can use it.

s> Nice idea though :)

Still is!

It's possible but we'd have to agree who would do it... May I suggest that all NeST SysOps with Internet access send a few Nest echos each? BTW -It also works for file echos.

ATB,
Karl.

My internet access isn't charged by the minute, so I'm the logical candidate.
However... Ever since my ISP "upgraded" his OS, inbound email works ONLY with
Antmail, which is a PITA. I'm working on getting a "true" UUCP account, and
when that is accomplished, this whole idea will be much easier to implement
from my end.

s> Later, when I have a real UUCP here, yes, it will be possible, but
s> right now, your best option is a NeST private node.

Why not just a STandard (they you go Karl a plug for you :) NeST point like 90:106/172.12 (my old NeST address). This is easier to set up for the sysop and user and doesn't require you to submit app forms.

s> NESTKIT (includes the NeST application and a NeSTlist, not necessarily
s> the latest, however).
s> BTNC
s> IOSmail or Jetmail (IOS is freeware; Jetmail is faster and a bit less

I'd recommend IOS myself, but then I'm biased, I'm one of the programmers v0.91pl9 has just been released and is as stable as anything up here on my STe under MagiC 4.

s> buggy) Tmail, LED, or other fido-style message reader

LED v1.22 is also freeware, or you could just wait for my NewsAgent program.

s> Suitable archiver(s) (STzip recommended; ARC supported; LHA acceptable
s> but not recommended due to too many semi-compatible versions)

I use LHarc with my mail to and from STandard everyday with no problems. Providing you use the same version as your sysop you'll have no problems

s> UUcode software (ESScode or Guy Harrison's UUcoder recommended)

s> Patience.

:)

s> You have to fill in your NeST app and submit it as a private node to
s> whomever
s> you wish to get your feed from with a request to have it forwarded to
s> the proper RC. Use the temporary address (90:XXX/999.0 where XXX is
s> the rgion you'll be connecting to) to set up BTNC, IOS/Jetmail, and
s> your mail reader while you wait for a reply.

Is there any reason why you can't just be a point?

s> You /must/ be able to write and pack netmail in order to get a node
s> number. The only tricky part will be manually UUcoding the outbound
s> packets, which must be emailed to AUTONET at your host system (me or

But if you get setup as a point first there is no need to worry about sending NETmails as you don't need to send in forms.

Also, when I became a point of STandard (Karl Foley's board), I was sent an LZh archive containing all the software preconfigured for my point so all I had to do was expand it to my floppies as I was using then and work out how to run it :)

s> It sounds complex, but the whole process takes less than a minute once
s> you have your private node set up.

Someone ought to write a program to scan your emails and automatically extract any NeST stuff. Couldn't this be added to net2net or something?

See you earlier,

Steven

1) Obtain data book from Zilog or AMD
2) Look at linux device driver: tsx-11.mit.edu:pub/linux/680x0/
Browse around in there, and you'll find source code for various
kernel versions. Grab any of them (preferably 1.2.13pl.. or 2.0...)
When you decompress the .tar.gz archive, look in
drivers/char/atari_SCC.c and .h

E-mail me if you need more info,

Art

3236. Floppy controller detection

Newsgroup: comp.sys.atari.programmer
Date: 1996-09-17 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <9117cc$131628.392@HERMES>
Source record: 9029

How does one detect which floppy controller a computer has?

As part of my DESKFMT program (a plug-in replacement for the MultiTOS disc format/copier), I would like to be able to detect which floppy controller is fitted to the machine, so I can auto-configure the program and disallow capabilities above and beyond that available from the FDC.

Other than looking for the _FDC cookie and the _SWI cookie, what else can I do?

The _FDC cookie will not, AFAIK, be available in TOS versions prior to 4.

The _SWI is available from v1.06.

However, both are unavailable on TOS 1.04, as 1.04 has no cookie jar.

And, of course, they could be mis-programmed (ie incorrect cookie data)

Hello,

Does anybody know how I can redirect the output of a TOS program
and process this output myself ?

I would like to launch programs via the shell vector and than put
the output myself on the screen. I believe that is exactly what Gemini
does. I thought it could be done without bending vectors, just by using
Fdup and Fforce but until now I didn't have any success.

Greetings,

Dirk Nissen.

Last time I looked, points weren't allowed. Having just perused the current
Nest Policy document (.196), it appears that that particular restriction has
evaporated.

> s> IOSmail or Jetmail (IOS is freeware; Jetmail is faster and a bit less
>
>I'd recommend IOS myself, but then I'm biased, I'm one of the programmers

Oh, for anyone who is short on funds or not carrying tons of message areas,
IOS is great. I used it myself quite a while ago, and it was a VAST
improvement over what I had used previously (ACS? Long time ago, I'd have to
ask Vroomfondle). For a system like mine, with over 100 message bases and 4
or more networks (I lose count), Jetmail is better.

> s> buggy) Tmail, LED, or other fido-style message reader
>
>LED v1.22 is also freeware, or you could just wait for my NewsAgent program.

I wasn't aware that LED had ever been freeware. It's currently on 1.4x,
innit?

And what about Newsagent, then? Specifications, please.

>I use LHarc with my mail to and from STandard everyday with no problems.
>Providing you use the same version as your sysop you'll have no problems

Key words being "same version" - which was my point. If you ever link a
system run by a PC Puke<tm> (as I will be doing shortly), Zip is better anyway
- they have SUCH difficulty with everything else. <G>

> s> You have to fill in your NeST app and submit it as a private node to

>
>Is there any reason why you can't just be a point?

Not that I can see now, no. However, anyone linking to me will have to fill
out an app anyhow - point or node, I want details for use when
troubleshooting.

> s> You /must/ be able to write and pack netmail in order to get a node

>
>But if you get setup as a point first there is no need to worry about sending
>NETmails as you don't need to send in forms.

Not for forms, no. However, I didn't notice it in the Nest Policy, but Fido
Policy requires the ability to send and receive netmail as a prerequisite for
membership. I feel that's important, else how is your uplink going to let you
know that your system is wonky? In email, if you have Internet access (which
is what this whole thread is about, of course), but netmail is still a vital
part of any ftn.

>Also, when I became a point of STandard (Karl Foley's board), I was sent an
>LZh archive containing all the software preconfigured for my point so all I

Could be added to Wormhole, and since my ISP has bunged up email for NOS, I
think I'll do that Real Soon Now. I'm tired of manually UUdecoding packets.

i have been tested 3 emulators on my p.c. tos2win,gemulator 96,and magic
pc
(demo version)
the ratio of compatibility is under at 10%
every atari software then i've been tested not works at 90%
well ! this is my questions :
1) if i had the rom card with G.E.M. in my p.c. they are much
compatibility with these 3 emulators ???

2)they are anybody here can i have 1 of these 3 emulators whith G.E.M.
card
and what are the compatibility ??

3) what of these 3 emulators is better

4) thank's to all for your answer because i want to buy this solution but
the report of compatibility in demo version does not seduct me !

TO BE CONTINUED....

5) AND NOW I KNOW WHY GEMULATOR DOES NOT SUPPORT A LOT OF
ST FLOPPY BECAUSE IF YOU HAVE DISK FORMATED AT 10 SECTORS PER TRACK
GEMULATOR CAN NOT READ THIS FORMAT THIS IS A REAL PROBLEM BECAUSE ALL THE
ST GAMES ARE IN THIS FORMAT FOR EX:DUNGEON MASTER !
IF THERE ARE ANYBODY HERE CAN KNOW AN EMULATOR CAN SUPPORT THIS FORMAT
PLEASE HELP ME AND SEND ME A MAIL !!!

BYE ALL ! FROM DDRCREW !
(excuse for my little english i'm french!)

3243. 40Mhz accellerator + Falconspeed = Kaboom?

Newsgroup: comp.sys.atari.programmer
Date: 1996-09-17 00:00:00 UTC
From: herman@dialis.xs4all.nl
Message-ID: <50a_9609180531@dialis.xs4all.nl>
Source record: 9036

Hello Everyone,

I recently joined the group of Falcon owners.
My Falcon already has a Falconspeed already installed, and there is an accelerator that is not yet installed.
I checked out the accellerator (from Digital Data Deicke [a German firm]) and it consists of nothing more than three little black boxes with labels on them and wires coming out.
On the labels is a description telling which wire is to be connected to which pin.
Two of the boxes definetely have cristals in them (one supplies 40Mhz to the 68030 and one supplies 50Mhz to the dsp)
The owner, which I definetely *DO* trust btw, told me he hadn't the experience to do it.
Now I have some problems:
-I don't know if this accellerator thingy works with the falconspeed.
-I don't know if I can still install a coprocessor.
-If a copro can be installed, I don't know which one (what clock speed)
-I don't know what I have to do to make sure that my Falcon doesn't spit smoke after running with the accellerator gizmo.

Oh phuuuleez someone help meee,

Herman

Most of this stuff should be readily available via my bookmarks page. The
"Captain's Seachest" links to my ftp space, and I'm filling that up all too
quickly (only 5 megs available space, I'm sorry to say).

>Someone also mentioned a program that helps in setting up Binkley, that
>makes it easier to set up. What program was this, again?

I use Semper, so I really don't know about that. Bill Scull is the current
developer of BTST - best to ask him in AtariNet.

My bookmarks: http://www.3rdplanet.com/~starship/atari.htm

Hi,

I need very very quick help for an Ethernet card called RIBEL C90.

There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030 ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?
Could you give me more informations about the jumpers because I have
no documentation of it !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herve

Degas.
It's best to grab the image you've done in Degas using tyhe rubberband method
in WImage. If you grab a few pixels too many around the image you can edit
them out in WERCS and set the image size accordingly.

v1.22 was the last LED produced by Volkmar and Roland. Since Stephan took over the development it has become shareware.

: Most of this stuff should be readily available via my bookmarks page. The
: "Captain's Seachest" links to my ftp space, and I'm filling that up all too
: quickly (only 5 megs available space, I'm sorry to say).

I took a quick look, though I'll have to take more time to look through it some more. Seems you've been putting quite a bit of work in it since I was last on it! Keep it up!

However, I'm more interested in finding the FidoDoor program than the other stuff, since I think there's been some updates since. If I have to, I'll make a long distance call to the guy's board, unless someone lives near him and it's a local call for this person.

: I use Semper, so I really don't know about that. Bill Scull is the current
: developer of BTST - best to ask him in AtariNet.

I unfortunately have no Fido or Atari net access at the moment, as the accesses I've had were over local boards. At least most of them want a subscription rate to get that access. None of them have AtariNet access, as far as I know. Does he have Internet access? I think I may have noticed his name somewhere around on the net. Now that I think about it, I may have noticed some sort of program to help out in the BTST setup in one of my many Atari CD ROMs... Gotta look...

Well, it sounds like the DDD accelerator allright :-)

> Two of the boxes definetely have cristals in them (one supplies 40Mhz to the
> 68030 and one supplies 50Mhz to the dsp)

OK.

> The owner, which I definetely *DO* trust btw, told me he hadn't the
> experience to do it.

Well, you'll have to find somebody who has experience with soldering and
you need a good fine soldering iron, which doesn't get too hot.

> Now I have some problems:
> -I don't know if this accellerator thingy works with the falconspeed.

FalconSpeed can work with up to 36 Mhz CPU and 18 Mhz BUS, and as far as
I remember the DDD accelerator has a 36/18 Mhz setting too.
40/20 Mhz mode is a bit uncertain though. And it is not guaranteed that
your Falcon will work properly with 40/20 Mhz mode, not because of the
heat, but because the DMA sometimes gets very upset with a 20 Mhz
system BUS, it won't smoke or anything like that, it just doesn't work
properly. This can be fixed though with some hardware patches.

If you can't get your Falcon to run with 40/20 Mhz, you should consider
buying the brand new accelerator from TITAN DESIGNS called NEMESIS.
It has a special hardware patch, which makes 97% of all Falcon's run
correctly with the DMA-chip up to 24 Mhz BUS!
The CPU isn't double clocked though, hence the system runs with
24 Mhz CPU and 24 Mhz BUS. But this setting gives a very good
performance raise anyway, since the BUS is a lot faster.
You can also run at 640x480 in TrueColor non-interlaced in SVGA-mode
with a 24 Mhz BUS! Maybe even a bit higher...

> -I don't know if I can still install a coprocessor.

That shouldn't be any problem, as far as I know.

> -If a copro can be installed, I don't know which one (what clock speed)

Well, if the DDD-accellerator has FPU acceleration too, say up to 40 Mhz,
you must buy an FPU rated at 33 Mhz (MC68882-33), these can also cope
with 40 Mhz clock-speed. I have mine running at both 36 Mhz and 40 Mhz,
without problems, and it's a 68882-33 chip.

If you can't get a 33 Mhz FPU, just avoid connecting the acceleration wires
to the FPU and it will only run at BUS-speed, that is either
16, 18 or 20 Mhz clock, depending on the accelerator setting.

You should however be able to find information on this in the DDD-
accelerator manual.

> -I don't know what I have to do to make sure that my Falcon doesn't spit
> smoke after running with the accellerator gizmo.

If you install the accelerator properly (as the installation guide tells
you), without doing anything odd, there
shouldn't be any problems at all. My Falcon has been running at 36 Mhz CPU,
36 Mhz FPU, 50 Mhz DSP for 2 years now without smoking :-)

> Oh phuuuleez someone help meee,

My accelerator is a FX-Card, which is an accelerator card that can
run at 32/16 Mhz, 36/18 Mhz (mostly used) and 40/20 Mhz (DMA-problems
may appear)
and gives the DSP 50 Mhz clock and the FPU the same clock as the CPU.
In addition to that, it can accept up to 10 MB FastRAM (FX-RAM) with
30-pin SIMM's, an additional 72-pin module can be connected to the
FX-Card if one prefers 72-pin SIMM modules instead of 30-pin's.

And as I said earlier, my machine doesn't smoke or anything :-)

> Herman

I hope these words can help you :-)

Taking 5 minutes to read what follows can change your life :

I saw an article in an internet newsgroup telling me I could make $50,000 within a month for an investment of only $5.

I thought it was a huge joke. I spoke to my wife, attorney and friends about it, and they all agreed it was some kind of scam. I can't stand scams, because usually someone gets burned, and I didn't want it to be me. Of course, I rejected the idea at first. after a short period of about two weeks ,I thought : "I have already heard of such things. But on the Internet ?!?!? ". I decided that even if I had to throw $5 into the fire, I wouldn't mind it that much, and gave it a try .After all I needed a LOT more than five dollars.

Two weeks later, I began receiving money -- every day! I could not believe it! Soon, hundreds, and then thousands of dollars began to roll in. Within 4 weeks, I had received a total of $32,445! It came from everywhere in the world. My bank account has changed its "-" into a big "+" (++++)!!!,I bought myself a car and things I wanted for a long long time for my wife and kids!

If you follow the three steps below, there is no reason why the same shouldn't happen to you! This is a legitimate investment opportunity. You invest $5, and you receive a return on your investment. So does the next investor. NOT ILLEGAL, NOT A CHAIN LETTER- PERFECTLY LEGITIMATE.

If you are not interested, then don't participate, but please print this article and pass it on to someone who may be interested, so they can take advantage.

The procedure is simple: 1) Write your name and address, an e-mail address, and the name of the newsgroup where you learned of this on 5 sheets of paper. Below that, write the words, "Please add me to your list." Fold $1 note or bank draft or money order in each piece of paper and send them to the following 5 addresses.:

1. Oleg Gorbik,
10834-97 St.
Edmonton, AB, T5H 2M3 CANADA

2. Nir Levi,
PO BOX 342
Yavne, ISRAEL

3. Landon
#1 Lakeway Drive
Conroe, Tx 77304 USA

4. Olivier Arcadipane
237 rue Francois Andre
7390 Quaregnon BELGIUM

5. Beyond Technology
5641 Apgar Street
Houston, Texas 77032 USA

2) Now remove the top name from the list, and move the other four names up. In other words, #5 becomes #4 and so on. Put your name as the fifth one on the list. Use a simple text editor such as Notepad, in your "accessories" window (If you have MS-Windows),or DOS editor. In fact, any editor will do.

3) Post the article to at least 200 newsgroups. There are 17,000, so it shouldn't be hard to find that many. Try posting to as many newsgroups as you can, and the bigger the newsgroup is, the more people are to see your message!

You are now in the an order services business, and should start seeing returns within a week or two. Of course, the more newsgroups you post to, the greater your return is. If you wish to remain anonymous, you may use a psuedonym, call yourself "The Manager", "The Boss", whatever but make sure your address is correct.

Now, here is why the system works:

-Of every 200 posts I made, I received 5 responses. Yes, only 5. You make $5 for every 200 posts with your name at #5.

-Each person who sent you $1 now also makes 200 additional postings with your name at #4. ie. 1000 postings. On average therefore, 50 people will send you $1 with your name at #4. $50.

-Your 50 new agents make 200 postings each with your name at #3 or 10,000 postings. Average return 500 people = $500. They make 200 postings each with your name at #2=100,000 postings=5000 return at $1 each=$5000.

-Finally, 5,000 people make 200 postings with your name at #1 and you get a return of $50,000 before your name drops off the list. AND THATS IF EVERYONE DOWN THE LINE MAKES 200 POSTINGS! Total income in one cycle=$55,000.

From time to time, when you see your name no longer on the list, you take the latest posting that appears in the newsgroups, and send out another $5, and put your name at #5, and start posting again. Remember, 200 postings is only a guideline. the more you post, the greater the return.

Lets review why you should do this. THE ONLY COST IS $5. Anyone can afford $5 for such an effortless investment with such SPECTACULAR RETURNS.

Some people have said to me, "what happens if the scheme is played out and no one sends me any money? "Big Deal, so you lose $5-but what are the chances of that happening ?? Do you Realize that NOBODY cares for the LEGAL chance of winning such a BIG money as 50,000.00 $$$$???? and all for a microscopic investment of five separate dollars? just think of all of the new Internet users that join the net every day!!!

There are millions of internet users, and millions of new net surfers every month !!! This is the great plus of the Internet, people all over the world can hear you and listen carefully if you talk reasonably. Everyone will take that chance ! I agree, If it wasn't the Internet, and was a small circle of people, the chance wouldn't have been so small. the amount of money had to be 200 times bigger, and the chances were zero. It wouldn't succeed.

But here, on the Internet, it is a giant village, where new thousands of members join in every day ! you CAN'T lose !!!!

Remember- read the instructions carefully, and play fairly. That's the only way this will work. Get a printout so you can refer back to this article easily.

Try to keep a list of everyone that sends you money and always keep an eye on the postings to make sure everyone is playing fairly. You know where your name should be.

REMEMBER-HONESTY IS THE BEST POLICY. YOU DO NOT NEED TO CHEAT THIS IDEA TO MAKE MONEY!! BESIDES,NOT PLAYING THE GAME FAIRLY IS ILLEGAL.SO LET'S BE REASONABLE AND PLAY FAIRLY,SO WE CAN ALL ENJOY THE INTERNET GOLD MINE.

GOOD LUCK FOR YOU ALL, And remember, play fair and you'll win, I don't want to mention what might happen to those who won't. AND AGAIN,SEE YOU NEXT TIME WITH SOMETHING YOU WANTED FOR A LONG TIME !!!

Hi!

I'm wondering if there is a program somewhere that is able to convert an
RSC file to C code?
It has to be able to convert CICON objects too.

Thanks,

Tomas

3255. MintLib for SozobonX w/ fork()

Newsgroup: comp.sys.atari.programmer
Date: 1996-09-22 00:00:00 UTC
From: thopman@uoguelph.ca
Message-ID: <5241hj$e4d@ccshst05.uoguelph.ca>
Source record: 8898

OK, so I grabbed the MintLibs for SozobonX, thinking I could you my nicely running Mint system for my Operating Systems programming assignment. Much to my dismay, however, it appears that fork() is not implemented, or at least, that's what it looks like from the unistd.h file. Is there a later verison of the libraries where fork() does work (I have v44 (?)). Will I have to install Gnu C if I wish to take advantage of Mint's features? Or even install Linux or NetBSD in order to gain a semblance of a fully functional UNIX programming environment?

Hello Atarilovers,

Perhaps you haven't read any letters like this for years, and Atari ST is now out of fashion. So, I'm speaking to that few people who are mad of this kickass computer. I would like to trade with ATARI ST games (I have about 200 of them...) via internet, e-mail, snail-mail or what. I'm also interested in STe and Falcon 030 games. Please let me know if you're interested. My e-mail address is thehidden@ludens.elte.hu (Yeah, you're right, I'm hungarian!!!), but if you reply to the actual atari newsgroup, that's all right too.

If you reply, I send you my list. And one important thing: I'd like to do this without sending money or asking for some bucks...

Cheers,

The Hidden (aka Sebi)

(P.s.> Mark Love, if you read this message, please contact meeeeeeeee!!!)

Yes !

an old but good program may do this very well, it is "WERKS", which was
produced by HISOFT. It is copyrighted and can be found also in the Lattice
C package.
Good Luck.

If it's a text file, I don't know.
But .sea is the extension of self extracting files packed with a program
on the Macintosh called StuffIt. As far as I know, it's only the Mac that
uses this format.

If this is an inappropriate newsgroup for this type of posting, please accept my apologies.

Pelican Consultants International Ltd are a search and selection agency who specialise in interactive entertainment - both hardware and software.

Many of our clients have asked us to keep a constant stream of candidates coming through to them as they continue to expand.

Throughout the whole of the UK, we have a need for programming talent. If not already experienced in the games industry, you will at least have a keen interest and will have suitable qualifications highlighting your abilities.

We are particularly interested in people with programming skills in 3D graphics, artificial intelligence and networking, but we are not merely limiting ourselves to that.

If you are working in the industry and looking for a move, or if you would like to enter an exciting and constantly changing marketplace, we can put you in touch with the right people.

All applications are treatest with the upmost discretion and we will spend a lot of time finding out about the job that you want to do, rather than just sending your details to anyone we can think of.

For an initial discussion, please send your details to me, Paul Rose, via private email or call me on 0181 423 3400.

We look forward to hearing from you soon.

Paul J Rose

If you want to convert the resource file entirely into C source code so
that you can compile it into the executable and ship a program that has
_no_ .rsc file then yes there is at least one program that does this.
But I can't remember what it was called! It was Australian and the
particular release I used had a couple of small bugs so that you had to
make a few edits in the output. But it worked. I converted a complete
resource with menus, icons, buttons etc into C source and built it into
the program instead of using an external resource file and rsrc_load
with little trouble. Of course the executable gets bigger by about the
size of the resource file. And it means no-one can edit the resources to
change the language (for example). This might be what you want!

If it's for the ST, try copying it to *.TOS and running it. An ST
self-extracting arhive will work, and if it's not an ST SEA, it will give a TOS
ERROR 35 or something similar.

I seem to recall that DC created an SEA depacker some years ago, anyone else
remember that?

Hi,

I need very very QUICK help for an Ethernet card called RIBEL C90.
=====
There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030 ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?
Could you give me more informations about the jumpers because I have
no documentation of it !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herve

I recall trying to get STSPEECH routines to work with GFA 3.07, and never having any luck. (I think I'd pulled them from a GFA 2.0 program.)

Somewhere on disk I think I have Modula-2 and/or assembly code for interfacing with STSPEECH. I'll see if I can find it; you may be able to adapt it to work with GFA 3.5.

NO!!!! It IS an archive, but for the MAC (or Spectre) ONLY!! It is a
Self Extracting Archive for the MAC, like a .tos self extracting archive using
zip2tos but runs ONLY in a MAC, and the files it contains are ONLY for a MAC!!!
You can unpack it in a mac, but it will do you NO GOOD on an Atari.

3275. Configuration file placement (HOME)?

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-01 00:00:00 UTC
From: mbecroft@tos.ak.planet.gen.nz
Message-ID: <GJBOBCUQUp@tos.ak.planet.gen.nz>
Source record: 8918

I notice now a number of programs (zControl, COPS, Start Me Up...) which
place their configuration files into the current user's home directory
(as set in the HOME environment variable).

I do not see this behaviour mentioned in any of the GEM references (including
the Atari Compendium).

What is the proper place for configuration files?

It seems to me that all software should place configuration files into the
current user's home directory, this way multiple users can have different
setups while sharing one copy of the software - saving disc space.

However, this does mean that users' home directories might become clogged up
with lots of configuration files.

In addition, many people will not be running a multi-user OS, and this would
not mean much to those people. I suppose that if the software did not find a
HOME environment variable, it would then use the directory it resides in to
store the configuration files.

The above is just my thoughts on the matter, however - what is the standard
protocol to use for placing configuration files?

long Maddalt(void *start, long size)

Maddalt() informs Gemdos of the existence of additional alternative ram that would not normally be identified by the system. (gemdos >= 0.19)

'start' indicates the starting address for the block of memory to be added to the Gemdos free list. 'size' indicates the length of this block in bytes. Returns E_OK on success or negative error.

Once the ram has been identified with this call is should not be removed and only be allocated with standard system calls. In addition, programs wishing to use this ram must have their alternative ram load bit set (or use Mxalloc()). Typically this call is implemented as an auto folder program.

Quite a few of these programs won't work properly if the HOME variable is
set to something like /users/root (Replace / with backslash). I had to
set my HOME to u:/i:/users/root (Again / -> backslash), otherwise SMU and
MultiStrip couldn't find their config-files.

Try e.g. the Blitter. you can even go on with the rest of the Program
while the blitter moves the block for you.

I'm not a demo coder. So I cann not say if the Blitter is faster than
move.l, but I guess, that the transfare in the background is a good
reason to use it.

BTW the 030er has some Instructions for Block moves. at least it is
possible to fill all the Registers iwith one Instruction and write them
out again with another.

Having a directory pointed to by a HOME variable is definitely the best way IMHO

That way, as you say, multiple users can have their own config files for
a common program. If you have only one user, and don't use Unixy stuff, then
you could always create a HOME directory called "CONFIGS" for example.

> It seems to me that all software should place configuration files into the

Most Unix software I've seen calls files ".file.cnf" - i.e. a preceding dot.
In a Unix system this will make it hidden, so listing the files from a shell
or similar will not usually show them. Unfortunately Thing shows dot files
even under a Minix filesystem :(((

The Atari desktop knows nothing about Minix filesystems anyway, so I rarely
use it now.

> In addition, many people will not be running a multi-user OS, and this would

Depends on the software, but most things will look in their own directory at
some point. Many check the root drive and C:\MINT or C:\MULTITOS first though.

> The above is just my thoughts on the matter, however - what is the standard
> protocol to use for placing configuration files?

I'm writing a little program myself at the moment, and what I've chosen to do is to look first for the HOME path (looking for the file both with and without a preceding dot) then in the application path.

There is no real "standard" but more and more things are moving towards using a HOME path (and a good thing to!).

Cheers,

Xav

My father has a Portfolio for several years; unfortunately
the battery expired before he had a chance to recharge it
this week.

When he tried to re-boot it after plugging it in, he got a
Divide by Zero error. Even a cold boot (if we're doing it
right -- it doesn't look quite like the picture) doesn't
help, he still gets the same error.

Since the manual simply says to reset and re-try or fix the
program in the event of a Divide by Zero, that's not a
whole lot of help.

Any ideas?
thanks a lot
Wendy W.

Fixed, as if by magic. By using the batteries (now recharged)
rather than the AC adapter, it began working.
Wendy W.

3286. FACE VALUE is NOW shipping in North America!

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-05 00:00:00 UTC
From: sft@sound.net
Message-ID: <533bsr$ql5@guitar.sound.net>
Source record: 8929

PRESS RELEASE

FACE VALUE - "Visual GFA basic" for TOS computers

Visual GFA programming is now a reality. As the first GEM program generator for GFA Basic, Face Value will create fully featured, solid, multitasking friendly programs almost at a click of the mouse. It will revolutionize GFA programming. Now you can devote your programming time to the task you set out to solve, and not spend weeks - or even months - on creating a modern GEM interface yourself. Face Value will do that for you.

How do you work with Face Value?
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
The program design is done in a resource-editor. Here you decide how the program will be presented to the user. Face Value will then load the RSC-file and write a complete, ready-to-run, solid GEM-program LST file. All you have to do is merge your own routines, and "connect" them to the Face Value-written code. This is easy to do thanks to Face Values well commented source code. The development time for your programs will be radically reduced, and as a lot of effort has gone into ease of use, even relatively inexperienced GFA programmers can now create first class, professional GEM programs.

Some features of the program:

* Windows with toolbars or toolstrips
(as seen in modern document processors or paint programs)
* Menu bars in windows
(Toolbox windows that will work in the background)
* Modal and non-modal dialog windows
* Animated icons (even with samples)
* Animated mouse pointers
* Realtime scrolling popup listboxes
(radio-, check- or menu listboxes)
* Radio- and menu image popups
* Multiline radiobuttons (round) and checkboxes
* Windowed progress indicator or animated busy-dialog
* Number scrollers for numerical values
* Switchable Menu bars with automatic shortcuts
* User windows with graphics or text (or both)
* Custom desktop that can be installed/deinstalled "on the fly"
* Alerts in windows - with standard, custom or animated icons
* Iconification on all systems
* Can run as accessory, just rename to *.ACC
* Intelligent ST-Guide support (context sensitive calls to
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

ST-Guide, automatic generation of ST-Guide sources for
documentation of the menu bars and dialogs)

You can also pick & choose from Face Value's expandable library:

* Fontselector support (xFSL)
* Full Selectric support
* Drag & drop support
* GEM clipboard support
* GDOS (all types) support
* Command line support
* Off screen bitmap support (with eDVI/NVDI 2.5+)
* Load & save IMG
* and more...

What are people Saying?
~~~~~~~~~~~~~~~~~~~~~~~
"ST Format seal of approval - 90%" (august 96): "If you want to give your GFA Basic programs real 1990s interfaces, then Face Value is a must." - 90%

ST Computer: 5 of 5 mice! (january 96):"Face Value - das ist eine Revolution furGFA-Basic-Benutzer....Und die ist jede Mark wert." - 5 out of 5 mice. (high points for those of us lacking German language skills: 5 of 5 rating, A Revolution)

What do I get?
~~~~~~~~~~~~~~
The program and detailed reference are in English, and are supplied with a printed English introduction. The reference and documentation is in ST-Guide format. Example programs are included. The on-line help system ST-Guide is included on a second disk. You must supply GFA interpreter 3.5 or 3.6 and a resource construction set (ie. RCS2, ORCS or INTERFACE) these programs are NOT included with Face Value.

How do I get my copy?
~~~~~~~~~~~~~~~~~~~~~
The North American Version of Face Value is distributed by Systems For Tomorrow, with Technical support provided by our new software division: Kordes Development. The North American version of Face Value is available NOW for only $69.99. Dealer Inquiries invited.

To Order, call (800)875-4943 (US/Canada Orders Only) or (816)833-4738. Or send E-Mail to sft@sound.net.

In Europe contact: Columbus Soft at 0049-6151-94383-0

It's DERCS from HISOFT which de compiles RSC files and turns it into 'C'.
It works very well on every RSC I've tried, including colour icons.

Hi folks,

I've hunted high and low for the AES opcode for the above function.
Can somebody tell me what it is please!

AES opcode for menu_unregister is 36. Note that menu_popup has the same
opcode. AES distinguishes between them via the number of parameter of
each type.

Cheers Peter

Hi,

As far as I know there does not exist an AES function named
menu_unregister, and I can't see what use it would be for. There does
exist a function called menu_register, though, but I guess you already
knew that.

movem.l if you use many registers.

Don't know if the Blitter can do the work faster, but I don't think so.

Setting the screen pointer is a quite fast way! :)

The Atari Programmer's User Group

Peter Hibbs, the editor of ICTARI, the Atari programmer's disk-'zine has given me the go-ahead to put some back issues (including the current one) on a web site. He hasn't seen it yet, so it could be subject to quite a few changes. The page contains five zipped issues (averaging around 250kb each), a facility to mail articles to me, which I will then forward, and some brief notes about how the disk-based version works. You can get to the page from my home-page at:

http://www.elis.demon.co.uk/

Or, you can avoid my warped sense of humour and cut to the chase at:

http://www.elis.demon.co.uk/ictari/ictari.htm

Have fun, and tell me what you think. I'd like to add more links to other Atari programming resources in the near future. Anyway, please give it a go.

Enjoy Theeselves,
"Augeas"

Hmm, yes, well.....

I would be rather surprised if it worked on the falcon!. I have
designed the pixel plot routine for ST high res mode (May work in Falcon ST
High Res compatible mode), and it accesses the screen directly.

Note, that this routine was only an experiment in using Stos
extensions and may not get developed further. (What with university course
work and everything!)

At the moment the extension has a plot routine (for ST high res,
rather fast!), and a fast version of CLS. I have figured out a way of playing
chip music at the correct speed (50Hz) in high res mode, and I may put this
into the extension if I can be bothered.

Would you like me to email you a copy of the extension?

Thanks for your reply!

Well, it not quite true, unfortunately. There are two modes you can use
the Blitter in. Either only Blitter and lock the system, or share time
with the 68k. The second mode only reduced the amount of time for the two,
so they're not really working in parallel, and this wont improve the use.

> BTW the 030er has some Instructions for Block moves. at least it is
> possible to fill all the Registers iwith one Instruction and write them
> out again with another.

This isn't only 030, it's on all 68K, called movem. It's only faster than
many move.l if you use a lot of registers, don't know how many, but I
think you'll have to use eight or more.
This would be my choice, if you can spare many registers for the move.

It's existence is mentioned in the MagiC 2 manual but no assembly
binding or explanation of its purpose. From discussions on irc it
seems there is a difference:

MagiC 2 app:
menu_register() then terminate removes the entry leaving a blank slot
in the "desk" entry.

Magic >2 app:
menu_register() then terminate removes the entry and removes the slot.

I'm simply curious to find out if menu_unregister() removes the blank
slot under MagiC 2.

First of all, what do you mean by shifting it around?

It is possible to use the DSP for image processing, but remember that the
DSP hasn't got very much RAM memory to use, so large pictures, or even
medium sized, can't be processed at once.
And, if only doing a filter or something like that, it would take too much
time sending data to and from the DSP to really make it useful, at least
in real time applications.

One good thing is that it is possible to use handshaked DMA transfer to
and from the DSP, which makes it possible to use the DSP completely
separated from the CPU, which will therefore be free to do other things.
The transfer rate on DMA transfers though are slower than the regular host
transfer, so it sort of depends on the application.

Of course, no matter the speed, it's more fun programming the DSP! :)

It's a function of GEM/2, that never was ported for the ST.
This function is also included in MagiC, but not in any other ST OS.
Take a look at MT_AES, the multi-threaded-AES-library. This library
includes _ALL_ AES-calls.

Hi All

I have a couple of computers I am considering upgrading and I was hoping that somebody out there in Atari Land could advise me as to what advantages I obtain through the upgrade, or possible disadvantages, ie. new Bugs, incompatibilities etc.

The machines I am considering are:-

STFM 4Meg, current TOS 1.09, No Blitter.
STe 4Meg, current TOS 1.62, Blitter Fitted.

In addition can anyone recommend a good source for the upgrade chips.

Fortunately, many image processing operation work fine even if you can
only have a small part of the image available at once.

>And, if only doing a filter or something like that, it would take too much
>time sending data to and from the DSP to really make it useful, at least

Uhm, doing a standard convolution filter is _much_ faster with the DSP
than anything you could do via the normal 16 Mhz '030.

On a 640x480 greyscale picture, MGIF does a 3x3 convolution in 0.8 seconds
using the DSP and a 5x5 convolution 1.11 seconds. (640x480x16 colour mode)
For the 3x3 convolution that is 9 multiplications, 1 'divide' and limiting
to 0-255 for the result. 5x5 needs 25 multiplications.

Granted, other image processing programs using the DSP don't come anywhere
close to that speed, but that's not my fault. ;-)

>in real time applications.

Yes, real time image processing needs serious hardware.

>One good thing is that it is possible to use handshaked DMA transfer to
>and from the DSP, which makes it possible to use the DSP completely

I've been planning to take a look at that. Could be useful for some things.

>Of course, no matter the speed, it's more fun programming the DSP! :)

That it certainly is!

The nice little card with an XC68040RC33 that's lying on a desk nearby
waiting to be installed will probably also be much fun, though. :-)

To the original poster: If you want to use the Blitter, I suggest you
get its manual from Graphics/blit.arc on atari.archive.umich.edu. Some
relevant paragraphs from it are:

The HOG bit, when cleared, causes the processor and the blitter to
share the bus equally. In this mode each will get 64 bus cycles
while the other is halted. When set, the bit will cause the
processor to be halted until the transfer is complete. In either
case the BLiTTER will yield to other DMA devices. [...]

[...]

The BLiTTER is usually operated with the HOG flag cleared. In this
mode the BLiTTER and the ST's cpu share the bus equally, each
taking 64 bus cycles while the other is halted. This mode allows
interrupts to be fielded by the cpu while an extensive BitBlt is
being processed by the BLiTTER. There is a drawback in that
BitBlts in this shared mode may take twice as long as BitBlts
executed in hog mode. Ninety percent of hog mode performance is
achieved while retaining robust interrupt handling via a method of
prematurely restarting the BLiTTER. When control is returned to
the cpu by the BLiTTER, the cpu immediately resets the BUSY flag,
restarting the BLiTTER after just 7 bus cycles rather than after
the usual 64 cycles. Interrupts pending will be serviced before
the restart code regains control. If the BUSY flag is reset when
the Y_Count is zero, the flag will remain clear indicating BLiTTER
completion and the BLiTTER won't be restarted.

(Interrupt service routines may explicitly halt the BLiTTER during
execution time critical sections by clearing the BUSY flag. The
original BUSY flag state must be restored however, before
termination of the interrupt service routine.)

I thought I'd heard that the 68030-based Ataris didn't have a Blitter
chip because the 030 could emulate it faster anyway? Or did that only
apply to the 32MHz TT?

> I haven't found much yet...

I have started writing about this on my homepage, at URL:
http://www.lysator.liu.se/~tobe/DSP/DSP-main.html

I haven't written more than what I have there, and right now my studying takes too much of the time I have. Ok, so I'm a little lazy too, I admit! More will come in the future, but the things so far are mostly introduction to the DSP, how it uses fixpoint numbers, it's registers and stuff like that. Nothing Atari specific is written yet, but I'm sure this can be found somewhere else.

I will gladly help anyone who wants to start program the DSP.

We have done this already and have working routines for handshaked DMA transfers both to and from the DSP. It's good if you have data that the CPU are drawing on the screen that the DSP has calculated. Then you can have two buffers, one the CPU is using and one the DSP uses, and flip between these.

In one of our latest projects, the Mpeg-2 audio player for Falcon, we also use handshaked DMA transfer to the DSP and nonhandshaked (frequent) transfer from the DSP to the DAC.

I'm currently working on an GEM interface for it. A VERY beta version of it can be found at
ftp://kaneda.hemmet.s-hem.chalmers.se/pub/nocrew/tos/mp2audio.tar.gz

Sorry about the .tar.gz even if it's TOS only, but there are depackers for these.

This version only works with an external 44.1Khz clock, unfortunately. The finished version will have support for internal clock.

I tried it. The function removes the entry but still leaves a blank
slot so is pointless implementing just before program termination.
Such is life. (MagiC 2).

I am actually using NOS to connect to my provider, the problem is: it does not work ! It works on a friend's SLIP account but sleeps on ppp+PAP authentication with my provider, running NT server+backoffice, accepting ppp+PAP immediately after modem connection.

I talked with David Nash, but trying "status up" in dialer or "ifconfig <iface> up" after connection to start ppp negotiation doesn't help, the line falls suddenly. I would even correct NOS sources, but I should work on NOS POP3 version not rebuilding also this stuff, so please, can anybody help me (at least to find those sources) ?

Hmm... have you ever thought about doing am mpeg-2 encoder as well using the DSP,
or isn't it possible? Now there isn't any encoders for the falcon so the
mpeg-2 player is rather useless, atleast for me. :-\

> I'm currently working on an GEM interface for it. A VERY beta version of

Nice. What will the GEM interface do? AS it's just a player it can't do much,
but it's nice anyway. :-)

3318. Problems with cpp (gcc 2.6.1)

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-14 00:00:00 UTC
From: fvk@cs.vu.nl
Message-ID: <Dz981K.Dq2@cs.vu.nl>
Source record: 8861

Hello,

Last week, I grabbed MiNT 1.14 of the web and tried to compile it
using my gcc 2.6.1 on my Mega STe4 running MiNT 1.12-Beta.
Compiling went ok, but somehow the preprocessor cannot handle the
'\' in a c-source to indicate that a *program* line continues after the
ascii 'end-of-line'.

Is this a 'dos/unix' problem concerning cr/lf? What is going wrong?
And, of equal importance, how to fix it?

Many thanx in advance!

Greetings

Florentijn van Kampen

3319. I need a Minix aware version of 'find' for MiNT

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-14 00:00:00 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-1410961430450001@47.85.0.99>
Source record: 8862
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari,st

Can anybody reccommend a version of 'find' which works with Minix partitions?

I am using the version from Knarf's German MiNT Distribution, GNU Find version 4.1 (I think). When I use 'find' on a TOS partition, it works as expected.

When I use 'find' on a Minix partition (30 character file names), it quits immediately with an error' memory exhausted'.

Also, can anybody tell me the correct way to pass arguments to find's '-exec' option. On another version of find, I had success with the following:-

find . -name *.ZIP -exec "ZIP -xrg {}".

When I try this with GNU find, it complains about no parameters for -exec.

I have read the 'find' MAN file, but can't make sense if it.

Help!
I am trying to update Telnet with Lattice C, using uncompleted
source from Dan Ackerman. I can run the program under lattice C in
debug mode just fine, but from the desktop it just gives me two bombs,
and crashes the computer. Totally. It doesn't even reboot right without
a complete reset.
Does anyone have any experience with debug who can give me some
help???

The Lattice sources for Nos 0.42 can be found FTP'd from
ftp.demon.co.uk. Look in pub/atari and you should find them fairly
easily. I have not found the sources for POP3 Nos myself either, so if
you do find them let me know!

Having said that, Nos 0.42 does contain POP source modules. I do not
know why they are unimplemented!

It's not me who has done the DSP code for this, it's Fredrik Noring.
See: http://www.lysator.liu.se/~noring

But there is a possibility there will be an encoder too. Not in the near
future though.

Mpeg-2 song can be found on http://www.iuma.com
It's slow, but some small songs can be fetched from there.

Well, it's just a shell for play, stop, load, pause. A future feature will
be to have lyrics to the songs syncronized with the playing song.

That's great! Even a CPU based one would do. Okey it will be very very slow,
but it's still better than nothing until a DSP based encoder gets released.

> Mpeg-2 song can be found on http://www.iuma.com
> It's slow, but some small songs can be fetched from there.

Well, as the internet connection from Ericsson already is ssslooowwww I guess
I will get nothing from this one.

Rather than re-invent the wheel (again), I am interested in locating source code to talk to the serial ports and any modems connected thereto, and can handle XYZmodem protocols.

Ideally it would be TSR-able at system start-up, and callable from the currently running app (or apps), although that last part is less necessary.

--

Well I'm certainly no expert on programming, but assuming you mean that it
runs fine from MonST under Lattice, then this _might_ be relevant.

A while ago I had a similar problem with code to read the joystick ports.
Worked fine in MonST, but not from the desktop. It turned out that it was
a simple case of the hardware needing time to initialise properly - single
stepping in MonST was giving it that time, but from the desktop it was too
fast. A simple for loop as a delay solved the problem.

Obviously this is unlikely to be exactly the same problem you're having,
but try looking for places where the machine needs some time to initialise
something.

Cheers,

Xav

The arguments don't usually have to be quoted, but there should be a
quoted or escaped semicolon (\;) to end the -exec arguments.

So what do you think is best: DEVPAC and using assembley or C ?
Which C is really good? Lattice C? or Something else ? Isn't there a simple 68030 compiler that will take assembley Language text files and turn them into PRG's ? Where do I get info on GEM and programming graphics, the blitter, I/O to SCSI or IDE or just "The SYSTEM", ho about serial and parallel port programming and god forbid the LAN port? Where do I get this information and a good Assembley compiler ? Which ones do you recommend ? There are some really comprehensive Assembley packages on the MAC in shareware land, anything like that for the Falcon? Thank-You!

Paul

I am interested in finding all possible details on the intenal IC's of the st, especially the MMU, and all atari custom chips. I would also like info on addressing the disk controller chip for floppy access, as I would like to write a bios/xbios replacement. If anybody can help me please reply to my address directly.

Chris.

This is general because I dont know anything about GFA ...

>-I am trying to brake into the world of Atari progrmaing under MagiCMac,

Any legally written Gem program will run under MagiC and thus should
do so under MagiCMac. The same applies for most of TOS. MagiC docs can
be found on some german sites and are only in german unfortunately.
Just a few days ago someone (name escapes me) said they were seriously
thinking of translating them to english.

>does anyone have some source code to a simple application of any kind
>which works under MagiCMac and can be complied under GFAtt (I have yet
>to find a place to buy this!). I know this is a lot to ask but I think
>it is one of the best ways to learn. I have a MagiCMac web page and
>would like to post some example code of my own it.

Start by getting some standard Gem docs. Experiment with AES calls and
a resource editor - this is the highest level and will give you some
understanding of OBJECTs. Try controlling a menubar - this will
introduce you to simple messages. Then try dialog boxes to understand
OBJECT's fully. Next try putting the dialog into a window - you wont
be able to do anything with the dialog itself but you will learn the
fundamentals of window messages and control. Check it works in
different resolutions. Now do the same thing in a window using the VDI
to draw text or graphics.

There's a couple of libraries for GFA which will take much of the pain
away I believe.

oic! I haven't looked at the code in any great depth and won't be
doing so unless I can port it back to Mark Williams C. This is not
going very well which is strange considering it was ported from MWC in
the first place!

That aside, I can telnet into my pop account and control it from there
if need be. Is that any use?

You need to get the Atari service manuals for a real understanding of what
goes on inside the ST.

The service manual gives a good grounding in how everything fits together
inside the ST. It does not contain detailed information on the custom
chips; for information on the others, try the manufacturer's websites, or
get a copy of the data sheets.

For more information, get a copy of the Tech manual, (should be on umich)
which will give internal block diagrams of the video system.

Paul D. Luscher (lenkel@inconnect.inconnect.com) wrote:
> So what do you think is best: DEVPAC and using assembley or C ?
> Which C is really good? Lattice C? or Something else ?

(I write predominantly for the TT and ST-series using Lattice C 5.60 and Devpac 3.1, but my code will also run on Falcons - I have yet to receive a "it crashed on the Falcon" error report [oops, I've just unleashed a few thousand demons, who'll guarrantee I'll get heaps of bug reports from Falcon owners in the next 24 hours])

Lattice 5.60 is quite good, but, depending on what you want to write, it may be worth your while looking at different languages.

ie DSP native code can only be generated by an assembler (like Devpac DSP), LAttice C will not generate anything but 68k code (68000-68040 and 68331/2) and FPU code (68881/2). Code for the 68851 MMU has to be written in assembly and linked in. (Obvious, I know, but I just thought I'd pre-empt a few nitpicks)

> Isn't there a
> simple 68030 compiler that will take assembley Language text files and
> turn them into PRG's ?

For intricate programming within a predominantly Lattice C app, the included assembler is satisfactory. However, if your assembly code is very intricate or makes use of deeply nested macros (or recursive macros), the lattice C assembler will barf. Therefore, I use Devpac 3.1 on those tasks (it will generate a Lattice object module that can be linked to a Lattice app).

> Where do I get info on GEM and programming

> do I get this information and a good Assembley compiler ? Which ones do
> you recommend ? There are some really comprehensive Assembley packages on
> the MAC in shareware land, anything like that for the Falcon? Thank-You!

GEM info is found in the (ARRGH! NOT SPIRAL BOUND!!) Lattice 5.60 manuals (If you can get a copy of the 5.x manuals, they _were_ spiral bound and will lie flat - or at least the ones I got with 5.06.02 were in 1991)

The Atari Compendium book is quite good on hardware level info, (register addresses, and bit layouts for some of those registers, but not _how_ to program them) but sometimes you feel that you need more. Usenet is a good second info source!

POP3 is mindbogglingly easy to implement - I've got a dead short C
program (<100 lines) that does a POP3 mail fetch using MiNTnet.

Text only, so re-working for NOS (though why folks want to is beyond
me) should be real easy.

Craig.

in Germany there is PROFI BUCH, and there is also English relase of thiz
book, and if I remember right it's called: ATARI COMPEDIUM
if hardware infos are needed, then also look out for HARDWARE v7.0 it's
a text document... should be available on SUNSITE.CNAM.FR /pub/Atari/...
under Docs (or something like that) directory... or maybe on FTP.UNI-KL.DE
/pub/atari/... (maybe "texts" directory)...

> Where do I get this information and a good Assembley compiler ?
> Which ones do you recommend ?
>
I think that DEVPAC v3.10 assembler (maybe there's later version) is the
best for Atari Falcon! [Devpac is a HiSoft product]
to contatc HiSoft: http://www.hisoft.co.uk/products/atari/

> There are some really comprehensive Assembley packages on the MAC in
> shareware land, anything like that for the Falcon? Thank-You!
>
really don't know if there're any shareware assemblers for Atari Falcon...
For Atari ST there was Turbo Assembler, but dunno if it was ported to
Falcon... BTW... for sure one of the best shareware DSP assemblers for
Falcon is QUICK-DSP Assembler by Audoly Gilles [FRANCE], available on
FTP://SUNSITE.CNAM.FR/pub/Atari/Falcon/Programming/...

On the telnet front it consists (for me from within Nos) of simply

telnet pop.dial.pipex.com 110

The pipex server then tersely introduces itself and sits there doing
absolutely nothing which gives the distinct impression it is a machine
not human interface.

USER maci38

causes it to report "OK <code> valid mailbox".

PASS password

causes it to report "OK <code> User mailbox locked and ready".

At this point I can type other commands such as STAT which tells me
how many emails I've got sat there. I'm afraid I've forgotten the
command to display an email (SHOW <email_num> perhaps?) (I only use it
to see if I should run AntMail). I do remember "DELE <email_number>"
(as shown by STAT) does remove emails.

QUIT

gets you out.

Not having read the relevent RFC's I've no idea if this method of
access if generally supported or not but as it returns RFC type error
codes along similar lines to Nos's NNTP and SMTP it could be worth
investigating further. ;-)

Hi Alexander,

If you are looking at GFA Basic, you can get a copy from Systems For Tomorrow,
sft@sound.net

Also, ask him about Face Value, it is like Visual Basic, object oriented programming and is designed to be used in conjunction with =
GFA. You still need GFA to put everything together.

All the best,
Chris @ Computer Direct

Yo,

Your code works but for the wrong reasons, take a look at this revised code
with comments you should get the jist of what's happening:

```
to_printer:
move.b #14,$ffff8800.w ; select port A register
eor.l #$20,$ffff8802.w ; ensure _STROBE_ is low
test_online:
btst.b #0,$fffffa01.w
bne test_online

move.b #15,$ffff8800.w ; select port B register
move.b d0,$ffff8802.w ; put character on port B

move.b #14,$ffff8800.w ; select port A register
ori.l #$20,$ffff8802.w ; set _STROBE_ to high

; possible delay code maybe needed here on faster machines ;

rts
```

On faster machines you may need to insert some code (NOPs will do) to stop
the code from desetting the _STROBE_ signal too early! Although this will
work fine on a standard 8Mhz machine.

Any questions then just ask.

Jr,

Sun Microsystems in their wisdom praised Java as THE ultimate runtime language that would work on ALL platforms. They forgot to say originally that they required a licensing agreement to be signed before you could take away their source code to compile Java for your own platform. Sadly this has scared all Atari coders away thus far...I could be wrong, but if I'm wrong then whoever IS compiling Java for the Atari is being very quiet about it!...:(

Wrong ----^
You have to use this
move.b $ffff8800.w,d1
bclr #5,d1
move.b d1,$ffff8802.w ; now STROBE is sure low

> test_online:
> btst.b #0,$fffffa01.w
> bne test_online
>
> move.b #15,$ffff8800.w ; select port B register
> move.b d0,$ffff8802.w ; put character on port B
>
ok.

> move.b #14,$ffff8800.w ; select port A register
> ori.l #$20,$ffff8802.w ; set _STROBE_ to high
Wrong ----^
move.b #14,$ffff8800.w
move.b $ffff8800.w,d0
bset #5,d0
move.b d0,$ffff8802.w ; set STROBE high

nop ; wait
; maybe more nop or here.

bclr #5,d0
move.b d0,$ffff8802 ; set STROBE low

; STROBE should be a pulse !

rts

NOTE: During this routine set irq-mask to $7 to avoid access of any
other routine (like the disc-check in TOS) to the PSG.

I have a problem, hopefully one of you can help ?

I loaded an overlay via Pexec(3,...), then used it via direct calling,
thus no further use of Pexec(). How do I get rid of it later again ?

First thought is Mfree(basepage), but this is probably not the proper
way. What about environment, does it need to be freed separately ?

Cheers Peter

The real reason is that until very recently there was no way for Java applets
to run on Ataris, because no OS supported real threads. It appears to me
that recently released MagiC 5.0 could run Java applications, but there
wasn't enough time for the coders to come up with something useful.

Cheers Peter

You've got the method exactly. Use Mfree() to free the environment, then
the basepage.

Hello ST-fools,

I'm looking for a girl, Carole Lepilleur. He had a letter on one of the Atari newsgroups. I discussed several sings with her, now I've sent a letter again, but haven't got any reponse yet. Now, I "fingered" her and got this reponse:

Account used on Tue Oct 1 10:08 (23 days ago)

It was long ago. Carole, if you're reading this, please write to me to "thehidden@ludens.elte.hu" or "sebi@augusta.inf.elte.hu"!

Thanks!

The Hidden

(P.s.> If someone of you know her, please tell her to contact me.)

3360. problems with man pages...

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-24 00:00:00 UTC
From: Dale Philip Needham <needhadp@eng.derby.ac.uk>
Message-ID: <326F9C76.44F9@eng.derby.ac.uk>
Source record: 8803

Hello I use a falcon030 with 4M ram and a small hard disk. I have
tried to install the rest of MiNT, i.e. that over and above what you get
with multiTOS, most of what I have got works except the 'man' routine.
This is driving me up the wall since the instructions on most of the
other utilities I have got are in man format.

Whenever I tried to run man I get one of the following:

A report that Nroff cannot find it's macro file (solved by reinstalling
the whole lot).
or when that works, typing [man xxx] where xxx is any man file I have
produces the following.

pause while program loads.
message [formatting page please wait]
another pause
message [aborted, sorry...]
program returns to command shell.

It does this under MiNT (with or without GEM), and under normal TOS. It
does not complain of missing files etc.

To start with it could not find files but now the Mint directory setup
has it's own (virtual) drive via the alias command in mint.cnf.

The only part of mint I don't use is minix due to a small drive size and
the fact that as yet mint is of little use due to this problem.

I am aware of one possible solution which is as follows:
can anyone post or email me (needhadp@sparcdii.derby.ac.uk) information
on the man page format, e.g. what the embedded command sequences are and
what they do so I can write a viewer that uses GEM and as such can be
used outside Mint etc.

Having used man on unix I would like to be able to decipher the files I
have got. I know you can read most of it but sorting the commands from
the text is a pain.

Thanks to anyone who can help, or direct me to those who can...

Does the 10sx emulate anything, Neil? You'll have to take a look in the
manual but usually you don't need a specific driver for each printer model -
just the one appropriate to its emulation mode.

I have a BJ300 which can either use Epson LQ850 or IBM Proprinter drivers.

3362. ka9q NOS

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-26 00:00:00 UTC
From: mike@interware.it
Message-ID: <358_mike@interware.it>
Source record: 8805

I want to get make changes to the Atari NOS ka9q version, and possible to the PC one.

I really would like to make NOS able to connect with a ppp PAP server. I am now able to compile NOS 0.42 with Lattice, but I need some help.

I would add POP3 routines as in NOSPOP3, but I cannot find the author of that version, and correct the ppp-pap problem, so:

I am looking for sources, just to avoid rewriting the pop3 client that is working good in nospop3, for this and to correct pop3 or to add new features, I think it would be enough to get the most recent NOS sources for PC, I tryed to do this, but unsuccessfull. I found sources for TurboC in Qualcomm Phil Karn directory, but seems to be old stuff, anyway the attach command does not recognize the ppp protocol (bug?). Mr. Karn says it is dropping this version going on with djpp or something similar, what is this ? I think I need the C version (or C++) to correct the Atari NOS.

My searches on the web give few interesting results about ka9q NOS, so please help me, I would also port to Atari any other PC stuff (written in C) that essentialy lets:

- connect in ppp pap to an NT server Backoffice internet provider
- email (SMTP - POP3)
- nntp
- ftp
- telnet (should be simple)
- scripts (automated sessions)

Please help me.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

3363. ka9q NOS

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-26 00:00:00 UTC
From: mike@interware.it
Message-ID: <366_mike@interware.it>
Source record: 8806

I ask you help to correct the NOS problem, at least tell me if any author can be reached by email, or any newsgroup or mailing list is available.

Here is where it fails to connect in ppp-pap, ack is received after pap, then a protocol is rejected, then a config option and then loop until disconnect:

```

: Does the 10sx emulate anything, Neil? You'll have to take a look in the
: manual but usually you don't need a specific driver for each printer model -
: just the one appropriate to its emulation mode.

: I have a BJ300 which can either use Epson LQ850 or IBM Proprinter drivers.

What Canon calls the BJ10 mode is actually IBM Proprinter mode (or at
least, that's the way it works on my BJ200). A BJ10 specific driver can
be font in the FontGDOS package:
ftp://ftp.uni-paderborn.de/pub/atari/tools/gdos/fontgdos.lzh
It appears that there are also archives of drivers for ink-jet printers
in the same directory.

Doesn't MiNT support threads? I never used this facility myself, but it all seems to be there.

From: Dale Philip Needham <needhadp@eng.derby.ac.uk>
Message-ID: <3274A53E.326F@eng.derby.ac.uk>
Source record: 8811

Does anyone know of a way to view man pages on a falcon? I have tried one or two manpagers but non of them worked, one crashed the other displayed the message :

"Formatting Page, aborted sorry..."

Both were installed according to instructions to no avail.

Ideally I would like the specification for man pages, i.e. what are the control characters & what do they do? So that I can write a simple pager package [TOS or maybe GEM].

It would help if you could email this info to me due to a shaky newsgroup setup in netscape 3 [problem this end]

Dale Needham
email : needhadp@sparcdii.derby.ac.uk
or

There is a gem-based man-pager at ftp.fu-berlin.de called manview.

> move.b d1,$ffff8802.w ; now STROBE is sure low

The .l should've been .w or .b but otherwise there is no reason to use your
method.

>> move.b #14,$ffff8800.w ; select port A register
>> ori.l #$20,$ffff8802.w ; set _STROBE_ to high
> Wrong ----^
> move.b #14,$ffff8800.w
> move.b $ffff8800.w,d0
> bset #5,d0
> move.b d0,$ffff8802.w ; set STROBE high

Again no reason to type all this code.

> nop ; wait
> ; maybe more nop or here.
>
> bclr #5,d0
> move.b d0,$ffff8802 ; set STROBE low
>
> ; STROBE should be a pulse !

That's just a matter of code ordering, it really makes no difference.

> seems to be there.

MiNT supports what all UNIX people call threads: the fork System call is
there since freeMiNT1.12.6 I think.

generally Threads are a bit different. Treads use the same Memory Space
(according to our Professor here who is lecturing about OS).

In Unix two Processes can never use the same Memoryspace. They can only
use shared Memory for some of their Data. This makes it easier to
implement Memory Protection.

Don't think MagiC can do real Threads. AFAIK the Concept there is
combatible to the MiNT concept.

All in all this should not matter, because Java uses the same Idear of
threads as Unix does.

Christof

3375. AES Window handling on STE's

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-28 00:00:00 UTC
From: rojewski@primenet.com
Message-ID: <553mbj$pin@nnrp1.news.primenet.com>
Source record: 8818

Is there some "unique" AES window handling in the STe TOS (1.62)?
I'm getting reports of windows failing to open the second time on
STe's. I may be issuing wind_close() on a window that has not been
opened yet. Also any window situations reported to cause lockups?

I doesn't seem to happen on my Falcon.

Thanks in advance,
John

Yes, there is, in:
ftp://ftp.uni-kl.de/pub/atari/graphics/raytrace

I may have some directory wrong, but something like that anyway.
I'm not sure if this is compiled 68000 or 68030 though.

Tomas

3379. ANNOUNCE: Atari Falcon MPEG Audio layer II realtime DSP decoder.

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-28 00:00:00 UTC
From: Tomas Berndtsson <tobe@lysator.liu.se>
Message-ID: <Pine.GSO.3.95Lrindlow.961028192834.11192C-100000@tintin.lysator.liu.se>
Source record: 8822

Yes! A new version is available, with lots of bug fixed and new features!

It can be found on these ftp's:

ftp://ftp.nocrew.pp.se/pub/nocrew/tos/mp2_07.lzh

Right now in this directories, but will be moved:
ftp://ftp.uni-kl.de/pub/atari/incoming/mp2_07.lzh

Read more on http://noring.org/mp2/
There you can also get the latest version.

A few new things are:

* The MPEG decoder now uses both handshaked and non-handshaked
DMA communication at once! This was made possible by a special
bit-shifting technology invented by NoCrew.
* The MPEG player doesn't take any CPU time! (except for loading
MPEG data from the disk)
* The decoder now features a GEM interface, also working as ACC.
* Several new options, including pause and stop.
* Automagical sync detection and recovery routines. This feature
enables you to load MPEG files (most cases) not properly aligned.
* Automatic clock detection. The program now checks if an external
clock is available, and uses it if so.
* If the program can't load any MPEG data for a period of time,
the DSP continues to replay until the buffer is empty. The
program will, of course, continue to replay when it gets a
chance to load again.
* Count down display.
* MiNT support, and several other systems.

All sources are included in the package and it's released under the GNU
General Public License 2.

We're also working on a version for Atari Linux.

Songs can be found at http://www.iuma.com
NOTE ONLY STEREO SONGS ARE SUPPORTED IN THIS VERSION! **NOTE**

Enjoy!

Fredrik Noring Tomas Berndtsson

Talking about man-pages, isn't there a good shell like C-shell or T-schell
for MagiC?? I would love to have a _good_ one. The shit (if you can call
that a shell at all) you get with MagiC is only, that's right, shit.

3381. YM2149

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-28 00:00:00 UTC
From: Taneli Mielikainen <Taneli.Mielikainen@club.mpoli.fi>
Message-ID: <55401o$73q@learnet.freenet.hut.fi>
Source record: 8824

Is there any standard format for YM2149?
..or any good trackers?
All kind of information would be nice.

TWN...

* Kivi (unregistered) 1.41a *

3382. a great idea that might help

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-28 00:00:00 UTC
From: okelly@indigo.ie
Message-ID: <5539jj$pmc@niamh.indigo.ie>
Source record: 8825

THIS IS A REAL OPPORTUNITY TO MAKE MONEY GET RICH QUICK If you want a lot of
money fast READ THIS!!! and it will change your life. I just read an
article in a newsgroup
describing how to make $ 50,000 in only one month from a $5.00 investment.
Participation is all it
takes to make this work. PLEASE PRINT THIS ARTICLE FOR YOUR REFERENCE AND
ACT NOW!!!
STEP 1:
Invest your $ 5.00 by writing your name and address on five separate
pieces of paper along with the words, 'PLEASE ADD ME TO YOUR MAILING
LIST".
You are paying for a legitimate service. FOLD a $1.00 bill or money order
inside each paper (for safe
delivery cover the dollar bill in the paper), and mail it by standard mail
to the following five
addresses:
• 1.Jason Segal, 5961 Glenhaven cres, Norfolk, Virginia 23508, USA
• 2.Rick Roehrich, 478 Conklintown Rd., Ringwood, NJ 07456, USA
• 3. Allen, P.O. Box 300, St. Peter, Minnesota 56082, USA
• 4.Chuck Rhoades, Rt 5 Box 172, Bowie, TX 76230, USA
• 5.D O'Kelly, 38 Brewery Rd, Blackrock, County Dublin, IRELAND

STEP 2:
Now remove the top name from the list, and move the other name up. This
way, #5 becomes #4 and so on. Put YOUR NAME in as #5 on the list. You can
use your real name or any other name but make sure your address is right.
You can do this by simply retyping this article or re-posting it to other
newsgroups with the edited address.
STEP 3:
Post the revised article to about 300 newsgroups. There are at least
17,000 newsgroups. Try posting to as many newsgroups you can. More posting
means MORE CASH!!!
STEP 4:
Your are now IN BUSINESS FOR YOURSELF, and should start
seeing returns within 7 to 14 days. remember internet is new and HUGE.
There is no way you can
lose. Out of every block of 300 posts, you will get at least 5 responses
(this is very very
conservative estimate). Yes, thats right only $5.00.No checks but real
CASH. Each additional
person who sent you $1.00 also makes 300 additional postings with your
name as #4, 1500
additional postings!! WUH!! At least 50 people will send you $1.00 with

your name as #4 (total
$50 based on a conservative estimate). Now those 50 new people will make
300 postings each
with your name as #3 or 15,000 postings. Average return, 500 people and
$500. These 500
people make 300 postings with your name at #2, that mean 5,000 replies
with $5,000. Finally
5,000 people make 300 postings each with your name as #1 and you get a
return of $50,000
before your name drops off the list. NO RISK. As you see, the potential
for earning is a lot of
money for only $5.00 investment. You MUST follow the rules. REMEMBER,
millions of people
use NEWSGROUPS everyday throughout the world. SAVE this article or get a
printout. GOOD
LUCK and enjoy your new found wealth. ACT NOW ! ACT NOW!

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer,comp.os.linux.m68k

I have for sale an Atari TT030.

Includes:
- 8 Mb internal memory (4 Mb ST-RAM / 4 Mb TT-RAM).
- 212 MB Maxtor.
- 48 MB Seagate.
- TTM194 19" monitor (1280 x 960 x 2).
- SLM804 laserprinter (just installed new drum and toner).
- Spectre GCR Apple Macintosh emulator.
- Lighthouse tower case with 150 Watt PC power supply.
- Original case and powersuply available and usable without soldering !
- DD drive.
- Also have a HD drive available but needs Ajax controller.
- 8 x 1 Mb simms for TT-RAM upgrade (needs another TT-RAM board).
- Lots of dutch Atari related magazines and books.
- About 175 diskettes with Atari software.
- And more.

All in one sale,
Asking fl. 1700,- (+/- US$ 1000,-)

Han van Almkerk

And of course, there's a man->ST-Guide convertor as part of the St-Guide
package. Never tried it, though ;)

Cheers,

Xav

Don't have a path, but iuma also have ftp on ftp.iuma.com
The connection is still slow though. At least from Sweden, may be faster
from US.

Enjoy,

Tomas

Christof Donat <cdonat@in.tu-clausthal.de> mumbled indistinctly:

>MiNT supports what all UNIX people call threads: the fork System call is
>there since freeMiNT1.12.6 I think.

Fork was always there wasn't it? I thought it was the non-blocking
vfork() that wasn't supported.

>generally Threads are a bit different. Treads use the same Memory Space
>(according to our Professor here who is lecturing about OS).

You can implement Threads by using Pexec (I forget the mode) to
execute a pre-loaded basepage and making it a copy of the current
basepage - this means that although it becomes a seperate process, it
shares the address space of the parent and executes in parallel.

Craig.

No no!
I guess you've got the program. If not, the latest can be found at:
ftp://ftp.nocrew.pp.se/pub/nocrew/tos/mp2_07.lzh

In fact, I recommend that you do download this file now, because I've
fixed a bug from the previous. If you drag a .mp2 file to the
mp2audio.prg, it will now start the program and play the song
automatically.

The songs are not Atari or Falcon specific. They are Mpeg Audio Layer II
format, a compression format. The normal extension to the songs are .mp2
and those can be found at iuma. Look in the directory /indexes at
ftp.iuma.com. There you can search by artist, by title or other ways.

It's a little tricky to see directly if the song is stereo from ftp. You
have to follow all symbolic links to the actual .mp2 file. Those files are
named stereo-title.mp2 or mono-title.mp2. Be sure to only get stereo as
this version only support those.

If you go through www, it's easier to see what's what.

Hope you find anything of interest.

Tomas

] Doesn't MiNT support threads? I never used this facility myself, but it all
] seems to be there.

It basically pretents to supports threads, but does not in reality. If
you call Pfork then the forked process is running but the first one is
not, and does not resume before the forked process terminates.

3397. Atari Programming, naturally!

Newsgroup: comp.sys.atari.programmer
Date: 1996-10-29 00:00:00 UTC
From: Terry Miller 2 <bitbrker@ipa.net>
Message-ID: <3276D894.3EBC@ipa.net>
Source record: 8840

Hi folks! I'm in the process of setting up a shareware company
called Atlantis Software Development. After perusing the computer
market as it stands now, I've been convinced that the two markets that
need attention are the Amiga and Atari markets. I've ruled out
programming for the PC and Mac's because those markets are already
crowded. What I am basically wondering is if there are still folks
that would buy video games for Atari computers, like Duke3D stuff,
and what they think is a fair price. I suggest a price of $20 for
the registered versions of the games. Of course, the shareware
"taster" is completely free. Within the next month I will be
establishing
a permanent Web page and Email address (right now I am using a student
account). For the moment you can write me at bitbrker@ipa.net with
suggestions and comments for the types of games you would like to see
and which Atari platforms you would like to see it on. The initial
Atari computer to be supported will be the Falcon, of source. But, I
am willing to support any Atari platform that can handle 256 color
displays and has at least a 68030 CPU. Let me know what you think!
I hope that you will be pleased to know that I am here to serve you
with great software for your Atari computer. I am not a fly-by-night
programmer, nor am I interested only in making the most money that I
can as a video game programmer. As long as there is demand for Atari
software, I'll be here to make it for you. In the mean time, I'll be
working on some games for the Falcon and Amiga systems.

Your friend, Terry Miller 2, Atlantis Software Development

P.S. Anyone who knows where I can get any interesting programming
documentation for the Atari computers, please let me know.
I am always anxious to add to my library! ;)

Someone will correct me if I'm wrong, but MiNT forks now work
properly, as of MiNT 1.12.6 and MiNT 1.14 (with VM). I am no
programmer, but maybe someone could look and see if thread
support is now sufficient for a Java port?

Yves

dnash@cix.co.uk or dave@chaos.demon.co.uk - I have not heard from him on Cix
for awhile so try the demon address first.

Will, it complain if it's not a stereo song or not? I'm not sure
what I have...

Anyway, it looks like it doesn't work on the Afterburner040. I get the
countdown (I guess it's the length of the song) and it counts
down, so it looks like it's doing something, but I get no sound.
